ed to earlier, they could
knock down the learning curve a bit with some thoughtful design
decisions to get some functions out of the environment window, and they
could improve the visual feedback and layo

n a dual G5 (2.5) and
with all the new add-ons, it just seems to get clunkier and clunkier.

Apple is moving to the Intel processor to put some much needed juice behind
their DAW. That's cool, except they apple have really let down a lot of users
who were conviced that their (our) G5 were the king of the hill.. You would
not believe how many friends of mine who jumped on the Dual G5 and upgraded
Logic as well, figuring that "finaly" we can really see this app(Logic) burn
rubber..Well, we were all fooled.. Even more, it seem that certain version
of OSX slowed not only Logic down, but other apps as well. sadly, today most
of htose users now run PT on their G5's.

If you check most online forums, you'd noyce thatthe most requested upgrade
users want from
