e using a compressed file format..Sounds Great!! The included midi beats are cool..

Very nice first product.. Upgrades are coming..It's really quite nice. With so many machines starved for PCI slots the firewire interface is great.

The only thing I wish they would improve is the interface. The UAD thing, a photo version of the actual device, would be best, but at least in the manual they should have pictures of the originals and explanations about how to use the plugs. Things like a Pultec is not always easy to get one's head around. I'm working on getting pics of everything next to where I mix so I'll have a reference.

TCB

P.S. Also, I don't have many of the originals, but I'll say this, the damn thing sounds great and the different models sound different. It isn't 12 variations on a theme.

>Hi,
I have DJ's p2B-LS motherboard with mmx 350 PII cpu, vintage right ?
This is for Lexicon core32 and two DSPFX cards and one Pulsar card !!
So now switching in beetween windows there is much latency ...
Memory is 192 mb and OS is Windows Me.
Don't please advice to get a faster computer !!
Just advice if possible what would cure that !!
Thanks
DimitriosHi,
Need this magma cable , any cheap resource ?
Thanks
DimitriosThe newer round one can be purchased from Magma. The flat ones are no longer
being made.

This guy says he can make them if you will sen

(859) 635-5762 So, I have a question....

Do people like this on YouTube have more money to burn than I do, or am I spending my money in the wrong places - things like housing, food, kids, wife? ;-) I should look into video taping running over an iMac with a Hummer H3.

They guy could have just sent the iPhone to me. Postage is cheaper than video production.

With the ADC discount, you could get a MacBook with 2.0GHz Intel Core 2 Duo, 1GB memory, 80GB HD, and a combo drive for around \$879.20. Did I mention that it will run Mac OSX, UNIX, LINUX, Windows XP, and Windows Vista? It will also run more software.

To each his own. I'm well aware that companies like Alienware have offered colored computers for years. Now that Dell has jumped on the band wagon, I would hope the fruit colored computer comments will end. I personally have never owned a fruit colored computer;)

P.S. I'm aware that Dell now owns Alienware.I have a spare flat cable. How long a cable do you need?

I believe the average in much of Europe, Japan, Australia, Canada and others
is 20Mb/s. Here it's a paultry 512k-1M,
and as a business I would have to pay \$99/month for that. Fortunately I
have access and a much better deal through a business here
in our building.

40G though.... dang. Sure it's possible (and I'm glad to see someone making it public), but will AT&T and others make even a fraction of that reality for the public without charging \$2k/month for it? Nope. Maybe in 15 years after they've milked the 1M-10M market for all it's worth and more.

>Ghost your image. Then...

I would first check out that ME hasn't automagically changed some IRQ assignments for you on it's own causing a conflict with video. It does that. Next, I would get a good nVidia video card and drop into the AGP slot. Be careful when you install the new card because it might try to install a newer DirectX version that could hose up your DX effects.

Also, get yourself a Power Leap CPU upgrade. I put one on my Asus P2B-LS (and before that the P2B-f) mobo and it's a WAY different machine. Hopefully they still have it, it's a celeron 1.3Ghz on a slot style mini PCB.

www.powerleap.com

Actually, the USB port takes precedence over the midi ports. I had the USB
port interfaced with the slave and the midi ports interfaced with the
master. Even with the Houston disabled on the slave, the midi ports would
not function on the master. That's about as exciting as it got. shux.....I
figured I'd at least get to smell some smoke.

;o)That reminds me a thing going around in the '80s where someone had put drug
references to recording terms...like balanced line=the producer and the engineer
got equal portions...line input=nostril and so on...

IIRC, I have a GB of RAM installed on my P2b. If you need some RAM let me
know, I think I have some 128 modules floating loose around here.

>HI Aaron,

If you have a compatible Fire wire chipset you "might" be OK. Even on new Core2Duo based machines the Tascam seems to have trouble running at lower than 10ms.

I can regularly use 1.5 to 3ms on MOTU and RME fire wire interfaces but they both use their own proprietary firewire designs. About support let me put it this way. MOTU has way better support at this point and it still has allot to be desired

Chris

(859) 635-5762 HI Dimitrios,

I would use at least a video card that has 32 megs of on board memory. I would have at least 256 megs of ram for the system but wouldn't bother with more than 512.

Chris

Why does anyone want this kind of junk anyway? Is it really that hard to
sing a few harmony parts? Jeez, send 'em over here. We'll harmonize the
sh*t out of 'em. :)

Well, I always have a 2 x track of a master mix done in a similar genre that I use as a reference when mixing anyway so this would be sorta' the same thing wouldn't it?.....now just picture Chris Lord Alge using a reference file of a mix done by Roger Nichols and you'll get my drift.

;oDYah, 95% of the public is listening to 3rd or 4th generation rips of high speed written, block errored to death CD's sourced from MP3's created quickly with bad sounding codecs...

Bandwidth? what bandwidth? ;-)

David.

>And if you are running an HD rig, the Mac route makes sense. (Of course there is no other option for Logic). I'm curious to see where the next version of Logic goes.

I've been wondering if Apple would give it more of a tie in with FCP - more post capabilities. Maybe this time?

Imho, Apple is missing a big boat by not letting OSX loose, but I have a feeling it might not play well with 80% of the hardware out there - one reason for a closed system, and of course, profit is higher with a closed platform, so I don't expect it to happen in the next 1425604 years. ;-)

Subject: Re: Classic Rock

product is completely unsupported and sold as a non-retail product (e.g. can't make a Mac version with full support and a PC version for the same price and none, but you could sell OSX for both platforms with limited support).

Regardless, as has been said before iWork is extra, not included, so that doesn't count. iLife is \$79 to upgrade to the new version, so it isn't exactly an OS "feature", and it's a home user/recreational set of tools, not something I would consider a must for professional use (iChat might come in handy for client communication, but Skype works quite well for free). iLife is an app just like any other.

\$299 for OSX? If it really provided some specific advantage for the price, but it's more than I pay for WinXP (I only pay \$139 for WinXP Pro (OEM) since I build my own machines (e.g. that meets the license requirement for the OEM version). Like Dave, I don't need iLife - just an OS, stripped down running fast. iWork might come in handy for only \$79 vs. MS Office since I don't need the full capabilities of Office and do get MS Word and Excel docs from clients, but again, it is an add on, not an OS feature.

Beyond that, I'm not what the context of your question is. Is Apple considering such a move?

Regards,
Dedric

That's cool. Both Apple and MS add stuff not everyone needs, and both are just trying to provide apps a lot of people do use. For me, whichever OS runs better for what I do would be my preference, regardless of who makes it - but without a standalone version of OSX it's hard to make that call since I can't pair it with the hardware I prefer. And without 3rd party support for Linux, that's out as well. If I ran Logic (which is a great app), no doubt, I'd have a Mac... or 2 or 3.

I'm also not knocking iLife - it is a nice suite of handy apps that MS doesn't have a comparable product (the functions are there in Media Player, Movie Maker, etc, but iLife's apps are more user friendly). I also wouldn't mind iWork over Office - I've seriously considered a MacBook for that reason (the "upgrade" to Office 2007 to run on Vista (I have Office 2003 or something like that) is \$275 - not exactly a bargain for more than I would ever use. I like that iWork supports MS Word Docs, Excel, and Powerpoint docs, and for only \$79. Seems like a good deal to me.

>you don't want.

true in both cases and not all macs are drag to the trash and that's
it. some require additional steps and searches to get all aspects
removed.

As a Mac user you would also know that those applications

>on your drive are not much of a performance hit, if at all.

i disagree dp vs logic= big performance hit on template setup for dp.
even at idle dp hits harder with the same track count

You might want

>to do a search on how to turn dash board off though, because it launches
>at start up. Also remove any thing you don't want running in the start up
>items.

same as in windoze msconfig

bottom line is their both just computers doing the same thing with
minor differences in execution.

dio/ video.
The power supply is an up market (ish) one can't remember what wattage it
is.
Yes I am using the current drivers and am using 2 19 inch lcd's
I'm using PT 7.3.1ur4 and whilst it records perfectly, it's quite
disconceting when the screen redraw pauses for a fraction of a second every
few seconds.
Nuendo and Soundbooth fly along fabulously as does Premiere Pro CS3.
I'm sure it's aPT thing as I remember seeing the same thing on an Intel
Macbook with LE a few months ago

fairly minor task to secure a Windows box. Get a firewall (or turn on the
M\$oft one), install patches, update virus definitions. If it's a production
box (audio or email) then nobody should be using it to web surf anyway, and
if they do it should be using a VM.

Now then, if someone wants to run cracks the download from the net and surf
porn sites, well, not much can be done then, but it's not rocket science
to run a Windows box.

No longer an apparent PC-only issue, even though this is an older article. By comparison our Mac updates almost weekly with security updates. I have yet to update PCs I built over a year ago. Is it possible this is more of an Intel issue than OSX vs. Windows? Or perhaps it really is just that Macs are so much less prevalent, esp. in corporate networks, than PCs.

10 years of PCs and never a virus, malware or spyware. And my current set of PCs don't have any virus protection at all, including the WinVista PC that grabs email all day. It doesn't take much to prevent this, and I've been using the same method on Macs and PCs, and life in general for years:

PC/Mac:

- 1 - don't open spam mail
- 2 - only visit sites you trust (this isn't that difficult to do unless you are an internet "explorer" that clicks on anything and everything ;-)
- 3 - don't click on popup ads

I do recall viruses being an issue for Macs in the earlier days. Imho, it's best to make direct comparisons - as soon as I get my hands on a Macintel and Nuendo 4 I plan to do plugin/loading tests to see which OS is really faster and more efficient for pro audio use, and price out the parts in a Macintel to see how much the nice case and OSX really cost. I like some aspects of Macs, and am no fan of MS or Windows, but when push comes to shove, much of the propaganda against PCs is unfounded and ill-informed. The rest, MS deserves.

Regards,
Dedric
