ogram that

can do the job), you can make your own playback testtones at exactly the volume you want to test with. From older days, to trim tape-recorders, we used testtapes. They had sinus testtones at 1000 and 10,000 hertz to make the playback-heads correct. at 0 and -10db. When the playback-heads was correct we used a sinus-tone generator to trim the recording head at 1000 and 10,000 hertz, to show the correct playback volume in both frequencies.

So here you are; you need a kind of sinustone generator to do the job. Be sure the channel faders in Paris are staying at 0db. Import a 440 or 1000 hertz sinus-file you know are staying at 0db into Paris(made by a program as CoolEdit etc.), just to control that Paris is showing the correct 0db playback-volume(it will, but just to be sure). Then use a sinustone generator with exactly the same hertz as used as playback to record with and use the recording trimpots to get 0db on each of the channels. So, I think that will do the job perfect for you.

Erling

>

> Thanks.

> CThanks all for responding about this issue. And yes, it has been an issue for sometime, but with little indepth coverage (of what I recall). Of course, I never had a problem till I purchased this new case. Prior to this new case I was in a 4U rack case which had lots of room to spare. Besides the front and rear fans, it had four internal fans hanging inside.. so it stayed chilly.. but it got noisy when I upgraded to the Pent 4. plus it was a beach to remove from the rack each time I wanted to do something different inside the case...

I'll do more shopping around and I will check out the digi BBS, once I find it. I recently seen a 7 card Magma (just the case) on ebay and the bid was around 200. When it closed, it was over 300. I didn't want to spend that much for an incomplete system.

Again, thanks alot for everyone's help and advice.... ~ Ed

.....you still have hair?They do sound nice, don't they? Funny, the C460B's got a bad rap years ago because some of the units exhibited distortion in the head amp and required a mod to fix it. Jim Williams does a pretty well known mod to these mics that is supposed to help them along. I never heard a problem with mine (purchased in 1997) and I like whatever it is that the circuitry imparts to a source, though it may be that there is a little harmonic distortion.....it doesn't seem to impart anything nasty, at least with the units I have here. The C460B's were discontinued.. The newer incarnation is the C480. The capsule is a cardioid capsule labelled CK1.

Room verb is 'real' heavy to one side I've found and some of the plugs that were in development also had this issue. I am not sure why that is, but it definitely is at my place. I typically end up panning up the verb return to compensate. After a while you just get used to it and use things to offset the lopsided signal, even using it to your advantage in certain situations. I have not noted anything like this in the VST/DX area, just EDS.
Another undocumented Paris 'feature', perhaps?

Thanks for all the suggestions. I tried the Awave program and wound up with the same situations as I had with Sound Forge and Wavelab. I dropped by the studio and talked with the engineer/producer who generated the disk and he checked back in his mix session and realized that he had generated SDII files, which until that moment he had no idea what he was making when he bounced to disk... so he called a buddy who explained to him that there was no way to convert that to a windows readable file, short of re-bouncing them to disk as wavs, which he claimed he wouldn't have a chance to do till after the new year. So in the interest of time, I'm just going to wind up mastering them from an audio CD that he generated for mix reference listening. He dismissed his engineering shortcomings by claiming to be a guitar player. Fortunately, the mixes he did sound great!

Thanks again guys for all the help!!!

CLC Can't you simply convert the SDII mix files on his machine to .wav's?

Would be WAY better to master those than a rip from an audio CD.

Shouldn't take too long to do the conversion on his end.

David.

>Remember 10+ years ago when you could hear hard drives working?

They would make these little bbrreeep and bbrripp sounds while accessing things?

Well, my 1 year-old Seagate 160G connected to the Mac Mini started making those sounds yesterday whenever I would access it.

Yipes, this is not right. So I ran some disk utilities but everything checked out fine. What the heck is going on? Then I noticed that the sounds seemed to have a stereo image, even though the drive is way over on the left side of the desk... Wha?

The drive sounds were coming from the monitor speakers!!

When I change the source on the passive volume control to something other than the computer output, the sounds disappeared. Switch back, they return.

That's the stupidest trick I've ever seen a computer do.

The drive runs, via USB 2 to the direct USB port on the back of the Mini. All audio sources, including all the media players and the Petersen StroboSoft tuning app work fine.

Ever seen this?

DCCan't say I've ever had a hard drive noise leak through to the audio, but I've got a 17" TFT Monitor that generates a little noise into my system. The strange thing is, I have two identical monitors side by side, but only the right one introduces the noise. If I switch it off, no noise. I chalk it up

to the ghosts in the machines.

Terrific product. I have had a VSII virtual strobe, and now I have a V-Sam and the software tuner.

I was a beta tester for the Mac version, so we got to help fine-tune the thing and I love it. It has all the sweetened tunings, variable concert pitch settings, a zillion intonation choices, an oscilloscope and spectrum display, and as many of your own presets, instantly

recallable as you want. The manual is even decent, and oh yeah, there is a PC version too. It even lights up which string you are tuning.

The sweetened tunings sound great too.

Evidently it runs nicely with most DAW's launched. I couldn't check it with Paris since there is no OS9 version.

BTW, it is very stable, more even than the stand-alone versions.

The deluxe version is only 79.00 USD.

I love it, I use it, I complained about the manual and a couple of non-functional features, and they fixed them asap.

Highly recommended.

DCGreat idea. I'll try it.

Yeah, Cron - check in with us if you read this..

TCThat seems like that would be the thing to do. I asked him about that, and neither he nor his buddy had no idea how to make that happen. I'm not a mac guy, so I couldn't tell him how to do it. I have calls in to a couple
