you dismiss Core Audio, or for

that matter the other core media elements, you might want to look into what's there. It took a lot of work for Apple to get to this point. And Apple is way ahead of the game on this.

Most of my software that needs it does advantage of dual processors and would take advantage of quad processors. It's actually not "just marketing." It's faster DVD encoding, more audio plugins (like I need any more than my dual 2.5GHZ can do already), faster animation

rendering, etc. etc.

BTW, when OSX goes Intel it will be able to take good advantage of the next round of Intel duallies.

Anyway, enjoy what you have. What matters in the end is the music we make.

Cheers,

-Jamie
