nsation AND allow you to
hear the plugin while tracking. Usually you have to pick your poison. DSP based DAWs (PARIS,
PT, etc.) almost
always have some very small amount of latency when playing back, but it's
exactly the same latency as the effect introduces when tracking. Native DAWs
usually have sample accurate latency compensation at mixdown but more latency
when tracking with an effect. I always suggest people track with cheapo hardware
effects if they really need them when using a native

Yeah, I've thought about this as a solution. Though I have a Mac, I'd probably (pending info on the Intel-Mac pact) implement what you mentioned on a PC. I'm just more familiar with the hardware. I've been thinking in particular about going with Live. I've been playing with some local electronic musicians lately, and both are much more computer based, in fact one has his whole rig on a laptop.

I think your both wrong, I heard it runs on laughing gas and natural methane;
)

JamesDoes anybody remember Edmond's Marshall plugin? It was supposed to analyze
a mix, then you could run your song through the plugin and it was supposed
to EQ and spit out a similar sounding production. I haven't seen it on their
site in years!

Maybe it was a joke!

Obviously you have never run a commercial Recording studio in Detroit. There's always some joker asking if he can pay you the balance later. "Yeah man, when I get my big record deal, I'm gonna take care of you!" It made me laugh, and no I never fell for it.

James

P.S. I was totally joking about the quick mix thing;)
