>They weren't the Every Brothers, but I don't remember Jan & Dean being all _that_ bad. Didn't they do Dead Man's Curve too? I thought the harmonies on that were pretty good, though it's been years since I've heard it. But my ear for pitch is only so-so, nowhere near as good as my ear for tempo, so I usually let the other band members decide if the harmonies are tight enough. Live, I seem to sing better than in the studio, maybe because I've been drinking and just belt it out, I've always been pleasantly surprised when I hear our live vocals and completely horrified when I hear my studio tracks.

However, I the official tempo Nazi in the band. And the designated guitar volume Nazi, anti-compression Nazi, less reverb Nazi, and a couple of other ones that don't come immediately to mind.

I think there's a line - a fine one perhaps, but there's
definitely a line. On one hand, if you're such a purist that
any alteration or improvement to the performance is like
pasting your face on Superman's body, then I would expect you
to use an upright bass, not one of them newfangled plug-in-
eel-lectric ones (after all, the P-bass was invented to improve
intonation vs. fretless uprights, wannit?), and

[View Forum Message](#) <> [Reply to Message](#)

I would also expect that if you DO record something, it would only be stereo mic'ed, whether it's studio or live - I mean why would a purist want to put different things on different tracks in order to process even in the most limited means, like to adjust the relative volume level between each instrument... that's not how the performance happened, right?

Personally, I think the line can be crossed for any type of correction... someone explain to me the difference between Autotuning something and making a singer do seventy-five takes each of the same phrase they have trouble with in every chorus? The fact that "they" actually (finally) sang it? How many takes crosses the line? Anyone ever record a sax player trying to Coltrane his way through a 16-bar solo, only to have him do about 20 punches to get it right? Where does THAT form of correction cross the line?

For me, it crosses the line at 10 takes. Everything after that is dookie...

DCAre you serious DJ? When you get caught between the moon and New York City.....

That's the first I've heard of any firewire problems on the Macbook.
What sucks about it? The firewire 400 specs seem to be the same on the non-pro as on the pro.

My wife uses the previous low end 1GHZ G4 laptop for audio recording with a firewire interface. Granted she's not stressing it, just doing VO, but it works fine.

Is anyone here using an Intel Macbook for audio?

The main performance differentiation between the two current Macbook/Pro lines seems to be the motherboard graphics on the non-pro vs. the faster graphics cards with the pro (and the available screen res). The mb GPU capabilities aren't sufficient for programs that really leverage the GPU, like Apple's Motion and the upcoming Color. BTW, the new version of Motion and the new Color look amazing, looking forward to working with them along with the new Final Cut in a few weeks.

Cheers,
-Jamie

www.JamieKrutz.com I'm available Friday for lunch and for a while that afternoon (have to be back by 5 or 6) - planning to see you guys there. I'm email you Jamie for times, location, etc.

Dedric
