Fixed it. Rebooted DAW, deleted existing array (which was hosed), created
new array. Everything works again. Am currently formatting a 160G WD 8MB
drive for audio.

;o)

Sounds like there is going to be a lot of very cool software at NAMM. Audio Impressions is showing, and perhaps releasing, an orchestral library that provides complete divisi control over the number of desks you use in a section in realtime, as well as more extensive realtime control than other libraries, space/location control, etc. In addition it produces a print score as well - supposedly a usable one.

The "downside" - it really requires 4 or more PCs to run, and one is dedicated to the control system software (min core 2 duo), one to your sequencer, the others to samples. They also recommend not running any other sample libraries at the same time (which is a limitation in all but dedicated film scoring setups with more than 5 PCs). Price could be high as well.

East West is supposed to be releasing their libraries with a new custom interface (no more Kompakt).

I am guessing there are a few m

>The Dells are always pretty good on the bang for the buck front. I'm thinking of retiring my two year old 630m into being a DJ only machine and getting a Core Duo model. One big problem now with RME gear. Pretty much all (if not all, I don't have time to look at the whole Dell site) use ExpressCard slots now, They're the update on Card Bus and, as the website explaining the tech says,

5. Are PC Cards and ExpressCard modules compatible?

The two technologies are not compatible. The decision was made to take advantages of advances in technology to simplify the design. The speed and size of the new ExpressCard design outweighed the backward compatibility issues.

So your SOL on pretty much all non-USB and non-Firewire I/O options. I wouldn't sweat it, a

multi media to your web Pages, and list your stuff
on the iTunes store. It also has integrated Pod Casts software. The iBook
has front Row, a multimedia playing and organizing software, with a wireless
hardware remote control.

The MacBook also has a built in isight video camera/ still camera, with iChat
audio video conferencing software. Built in wireless, including Bluetooth
2.0+EDR, I don't believe the Dell has Bluetooth???. The MacBook also has
built in firewire, I'm not sure if the Dell has that??? I don't know about
the Dell, the MacBook has the ability to plug in up to a 24" monitor for
extended desk top at up to 1920 x 1200 resolution. The MB has 6 hours of

battery life, I don't know about the Dell??? Industries say that Macs have better used resale value, i don't know if that's true but it something to consider. The MacBook has the advantage of being able to run more operating systems, thus, the ability to run more software, which gives you more choices.

I think if you add it all up, they are comparable Price wise, and one may have the edge.

that is in the Macbook is a whopping \$75. And you have a wealth of other
options, since Dell figures the person buying the computer might deserve
a chance to make some choices about what they buy.

None of which has anything to do with the original point I made, which is
that the mystical higher quality components in Macs simply don't exist.

it on solution.

I think that's where a lot of audio PC users are (not average users, but power/tech savvy users). It isn't so much about "us against them" as different requirements and decision making approaches - some want to turn on the switch and not think about it; others want to get a fast system and hotrod it even more, and the time is paid for in the gains made in workflow later.

My personal decision making process is simply one of numbers and my own application - if it makes more sense (power, speed, cost, upgradeability, software support without crossgrade costs), then a Mac is fine. So far, that cost has been noticeably higher than staying with a PC. I don't care which anyone chooses, as long as you see both sides equally.

My main reason for entering this thread is to balance what James said about PC users - that the conversations turn into bashing Macs, but I see it both ways. Mac users are also pretty adamant about Macs being an overall better choice. My other reason...okay, it's kind of fun in a twisted sort of way. ;-)
It's fun to talk geek/tech with other pro audio folks from time to time. Nice diversion from actually getting work done with these beasts. :-)

Regards,

Dedricl have not been around much lately so I may have missed a related post,

Sad to say Flying Burrito Brother Sneaky Pete passed this week.

If you don't know who they were, get Farther Along, a dandy good collection."DJ"

Waiting with beated...er bated breathThere are some things to consider. To start the Dell cost \$125.00 more to

add the Core 2 Duo 1.8GHz, Or \$200.00 more for the 2.0 GHz, so you looking

at \$875.00 to \$950.00 to start. The Dell has a 15.4" screen, which I think

is an advantage over the MacBook, although some people would Prefer the Compactness

of the MacBook's size. Jobs said some years ago that Apple buys the vary

best LCD screens, they pay more for first choice and their competitors buy

their rejects. I don't know if that's the truth, but I'm sure you guys would

say BS!

Anyways, the MacBook comes with a full version of Mac OSX, not a cut down

home addition. It would cost more to get XP Pro, so you would have to add

another hundred bucks. The MacBook comes with similar software to MS 8,

address book, iCal etc..

The MacBook also comes with the ilife suite of software. I would value that

at a bout two to three hundred dollars. If you consider say, Acid For GarageBand

your looking at around a hundred bucks. You would also have to come up with

the following: Comparable DVD authoring software that is as good as iDVD.

A Photo program that is as good as iPhoto for editing and organizing photos

and a High Definition video editing software that is as good as iMovie HD.

There is also iWeb for web page building that integrates with iPhoto, GarageBand,

and iMovie to up load your

I think your going to see some great desk tops come from Apple in the next
few months, I wouldn't count them out just yet!

Since you are talking about audio, I will speculate here a bit and say, I
think you may see PC software developers write more programs for the Intel
Macs. Maybe even your favorite programs! Adobe made announcements at MacWorld,

I wonder what NAMM, Music Messa, and NAB will bring. I wonder if there will be a Logic version for PC??? LaMont will still hate it no matter what;
) LOL!

Except that no one here or AFAIK at Apple has been claiming such a mystery for the current generation. Which is why no one has disagreed with your point, other than to note that it's old news.

I could use some fuel for the fire though, it's very cold in Denver today.

I'll kepp you guys posted. I decided to use the HD that I was going to be
the system drive in my Pariws rig today so I need to get another HD. After
that I'
ll finish the build. I'm going to order a Seagate or two for this DAW, I
think, and they don't sell them here in the snow covered wilderness.

I'll be glad to help when you start your build.

;o)

Posted by [Dedric Terry](#) on Wed, 20 Dec 2006 20:51:01 GMT
[View Forum Message](#) <> [Reply to Message](#)

=
Still=20
based on RME's
famous Hammerfall DSP series features and quality the =
new=20
PCI-Express
core ensures full compatibility and maximum performance=20
with
the latest high-speed serial bus technology found in all=20
newer
motherboards and computers. Furthermore RME=B4s FPGA core =
ensures
full=20

update capability via RME=92s Secure Flash technology,
for further =
hardware and=20
driver updates.

The HDSPe PCI Card is a short length PCIe x1 card =
that=20
provides
RME=B4s own high-speed serial audio data bus, as used in the =

Multiface,
Multiface II, Digiface and RPM. These systems are owned =
and=20
used
by ten thousands of audio professionals around the planet.
If =
users=20
are looking for a no-compromise high-speed audio solution
combined =
with=20
ultimate compatibility, these devices are still
state of the art. The =

Multiface II and Digiface solutions combine
some of the highest =
possible=20
audio transmission rates and low-latency
features you can realize =
with=20
card-based interface techniques,
faster than most serial solutions; =
combined=20
with flexible connectivity.
Artists and studios all over the world =
rely on=20
these combinations.
With the HDSPe PCI Card the further use of the =
existing=20
range
of RME=B4s I/O boxes in next generation computers is =
secured.
As a=20
special addition, the new HDSP PCIe series is prepared
to support the =
use of=20
the TCO, RME=92s Time Code Option,
with Multiface/II and =
Digiface.

The=20
HDSPe MADi card rounds up RME=B4s Premium Line MADi products
as it is =
now the=20
interfacing flagship to the MADi world.
The HDSPe MADi card offers a =
powerful=20
128 I/O-channel computer
connection. It supports 56- and 64-channel =
modes as=20
well as
Single and Double Wire formats. All 64 inputs and 64=20
playback
channels can be routed and mixed independently to 64 =
physical=20
outputs.
The HDSPe MADi turns every =93state of the art=94 =
computer
into a=20
powerful DAW (Digital Audio Workstation).
The HDSPe MADi offers the =
most=20
powerful router/mixer
implemented on a single PCI-Express card=20
ever.
Compared to the existing standard PCI MADi card,
the new =
PCI-Express=20
version offers several advantages,
like support for higher sample =
rates than=20

96 kHz,
TCO support and lower latency.

Both cards come with =
drivers=20
for Windows XP (multi-client operation
of MME, GSIF and ASIO 2.0) and =

brandnew Windows Vista drivers.
Apple users are perfectly served with =
Power=20

PC and X86 (Intel)
drivers providing Core Audio and Core MIDI=20
support.

The HDSPe PCI Card will be available worldwide from =
March=20

2007.
The HDSPe MADi Card will be available from April 2007.
The =
pricing=20

will be slightly higher compared to the standard PCI card=20

products.</DIV>

<DIV> </DIV>

<DIV>Hmmm.....if I don't get one of =
these, I=20

might.....</DIV>

<DIV> </DIV>

<DIV> </DIV></BODY></HTML>

-----=_NextPart_000_0199_01C73830.7D843330--And if the power cable came loose on your all
ITB 256 track with zero

latency dream machine, you'd probably be in the same situation

;-p

as everything to do with it.

I agree on PCI slots, hardware, etc. that's my big reason for staying with PCs, that and they are just easier to use as sample library farms (and multiple PCs also certainly work fine with a Mac/Logic as the main sequencer/host).

Actually for the \$90 saved, I would also be getting higher quality RAM (at least based on what past models have used), possibly a better hard drive,

more PCI slots, and more options on the motherboard out of the box, but yeah, it's only really relevant for guys like me that try to get the most out of it for a specific purpose. And yes it is in a pro use where the extra 5-10% can make a difference - even spending an extra \$90 or so I could get 2G which is a minimum for what I do - to add an extra 1G it's an extra \$299 (assuming the buyer would want to go DIY to save \$200).

Of course that doesn't make the Mac any less of a pro solution - it's a great solution.

It's preference - that's all I'm saying. There aren't stark contrasts that often seem to be purported in these threads. For most people it's shades of silicon and grey; but for some users, those shades are much more than a \$90 difference or a half day spent building a system.

this just posted to the RME forum:

The HDSPe PCI Card and the HDSPe MADi card are newly engineered=20 PCI-Express versions of their PCI successors. Still based on RME's famous Hammerfall DSP series features and quality the new PCI-Express core ensures full compatibility and maximum performance with the latest high-speed serial bus technology found in all newer motherboards and computers. Furthermore RME=B4s FPGA core ensures full update capability via RME's Secure Flash technology, for further hardware and driver updates.

The HDSPe PCI Card is a short length PCIe x1 card that provides RME=B4s own high-speed serial audio data bus, as used in the Multiface, Multiface II, Digiface and RPM. These systems are owned and used by ten thousands of audio professionals around the planet. If users are looking for a no-compromise high-speed audio solution combined with ultimate compatibility, these devices are still state of the art. The Multiface II and Digiface solutions combine some of the highest possible audio transmission rates and low-latency features you can realize with card-based interface techniques, faster than most serial solutions; combined with flexible connectivity. Artists and studios all over the world rely on these combinations. With the HDSPe PCI Card the further use of the existing range of RME=B4s I/O boxes in next generation computers is secured. As a special addition, the new HDSP PCIe series is prepared to support the use of the TCO, RME's Time Code Option, with Multiface/II and Digiface.

The HDSPe MADi card rounds up RME=B4s Premium Line MADi products as it is now the interfacing flagship to the MADi world. The HDSPe MADi card offers a powerful 128 I/O-channel computer connection. It supports 56- and 64-channel modes as well as Single and Double Wire formats. All 64 inputs and 64 playback channels can be routed and mixed independently to 64 physical outputs. The HDSPe MADi turns every "state of the art" computer into a powerful DAW (Digital Audio Workstation). The HDSPe MADi offers the most powerful router/mixer implemented on a single PCI-Express card ever. Compared to the existing standard PCI MADi card, the new PCI-Express version offers several advantages, like support for higher sample rates than 96 kHz, TCO support and lower latency.

Both cards come with drivers for Windows XP (multi-client operation of MME, GSIF and ASIO 2.0) and brandnew Windows Vista drivers. Apple users are perfectly served with Power PC and X86 (Intel) drivers providing Core Audio and Core MIDI support.

The HDSPe PCI Card will be available worldwide from March 2007.
The HDSPe MADI Card will be available from April 2007.
The pricing will be slightly higher compared to the standard PCI card=20 products.

Hmmmm.....if I don't get one of these, I might.....

The only software that runs in the back ground is DashBoard, and you can disable it, or completely remove it. But I don't think it's much of a hit on the system.

I'm still not sure why you think Mac OSX is bloated? I'm not sure why you think the first thing you would have to do is get under the hood and start ripping things out??? To me it would be like you getting a new 600 hp. Dodge Viper, and the first thing you want to do is rip out the AC system and passenger seat to make it faster, when all your going to do is drive it on the street. I would use a Mac out of the box for 6 months and worry about optimizing it later. However, if you want to hot rod a Mac, this is one of the sites.

<http://www.xlr8yourmac.com/>

Some of what you call bloat, like GarageBand you might find useful for song writing. Until you use it for a while, you won't know. Your thinking that you need a dedicated optimize audio work station, and that's Ok, but with a Mac you really can use it for everything without it being a problem. I guess it's a different line of thinking.

Honestly, I think it could be a bit of a hard transition for a hard core PC user. I think at first, nothing will be where you want it to be. I think it would be like being dropped off in a huge city you never been in. A place where they drive on the opocit side of the street and nobody speaks your language. It is to some extent like a whole different world. You'd have the basics down in an hour or two. After a year of honest effort, you will either hate it, or be totally hook. Either way, you'll truly know if a Mac is for you.

I'm not telling you to get a Mac, I think if you do, you will miss all your PC tinkering. Then again, I know you'll find away.

>>RME explicitly claims they can get lower latencies using cardbus v. firewire, so I would guess the same would be true of ExpressCard. That said, the market has to be vanishingly small for such a thing.

The real problem for me is that I already own an HDSP RPM which I plan to use for live DJ sets, but no way to use it with my current Dell. I might have to find someone still making laptops with cardbus cards . . .

But I'm not driving it on the street. My office computer is my street
machine and it's got tons of crap on it that I'd never want on a DAW.

> I would use a Mac out of the box for 6 months and worry about optimizing

Yeah. I'm familiar with that site. I used to read Thad's articles there.

Definitely different and no offense, but this goes to the root of my
misgivings about Macs. There have been so many outright lies told by Apple
vis-a-vis performance that the company has no credibility (with me at
least). Plus, I don't like the little smartass on their commercials.
;o)

I know. I own a Mac now. My wife uses it. I just give it sidelong dirty
looks whenever I'm in its presence and it's always ****ing up.

You'd have

Yes, it would definitely get *personalized* before too long.
;o) Links saved!!! Thanks. I'm gonna go down to our local Mac store and have
some fun with their demo machines. gotta try this stuff.

;oD

That has zero to do with what I posted originally. My point was that I have heard for YEARS that Apple somehow uses these super high grade components that make their hardware more expensive. I haven't had to set up a Mac in a few years, and of course the PowerPC versions were comparatively opaque unless I would go to the trouble of putting Yellow Dog on them. Which I didn't. But, because a co-workers' kid wanted to play a Windows game on his Macbook I had a chance to look at what kind of hardware is in a \$1400 Apple laptop. The answer is pretty much the same stuff that's in a \$750 Dell laptop, give or take a copy of iLife and a web cam on the Mac and a bigger screen on the Dell.

There are plenty of arguments for owning a Mac, the biggest one being personal preference. I was only seeking to put another of them to bed, that they use bending end components that put their hardware in another class than what I use. Quite simply, they don't, and the move to generic Intel hardware makes that quite clear.

Thanks

ChuckLAMONT!

I MUST MUST MUST HAVE THIS IMMEDIATELY :-)) I'm doing my best DJ impersonation..
This is SO COOL. The ultimate impulse buy for me. To bad it has to ship
from sweden! Is there any way to buy it for download?

Chuck

There are still some technology hurdles on the express card side of things. The spec is still a bit grey.

Also RME have stated on their forum about some companies coming out with card bus to express card adapter that look promising. I think they are on a wait and see how they work rather than investing resources on it.

There is a much larger user base for the pci cards so they rightfully are starting with those first.

Chris

Hey Nappy -

We all debate these things as if they really matter, but it's just a means
to an end. Macs are great systems - the best comp is the one that serves
you best.

>

<http://www.apple.com/support/mac101/>

I know this is going to sound obvious or elementary, but another good source of information is under the help menu in OSX. Just type in a keyword or short question, but start with the mac101 first.

After you go through mac101, then check this out.

<http://www.apple.com/support/switch101/>

I think that Apple will release the Core 2 Quad 8 processor machine in the next 3 to 4 months. By July for sure. I would wait to buy, if that's what your thinking. Their release schedule is all different now with the Intel chips???

Be careful, some of those demo machines are FUBARed! Some people actually try to hack and sabotage them. Or is that your purpose? ;)

On your PC you have a good cognitive map of where every thing is and how it works. Like I said, Mac OSX will be like being dropped off in a strange city. A good way to get a better understanding of Mac OSX is to read all the info here:

I have tried all.
This demo has a fixed latency at 90 ms !!
Even if you lower its settings it can't go under 45ms with Paris.
Don't know if the retail version can do lower but I doubt it.
They have big latency if they work at all...
Only senderella works 0 latency if you put edstransf

Regards,
DimitriosNo demo!!! I'm not sure but it looks like it's VST 2.4, and of course, it
Windoos only.

Wow! Man and Machine.Yes John, you should sell it to me! Since I'm a nice guy I'll give an even
thousand for it. ;>)

Seriously, if I could afford it, I'd have a TD-20 kit with some extra cymbal
triggers controlling BFD or DFH. Check the videos at Toontracks for some
excellent live jamming (TD-20 triggering DFH). www.toontracks.com

RPM running now does it ;-)

Do you know of any laptops that are higher performance, reasonably priced, and still have cardbus slots?

```

This might be a last second, Hail Mary move to keep VMWare visible at the horizon, but Innotek has GPL'd (v. 2 only, extra credit if you know why that matters) VirtualBox. Runs on GNU/Linux and Windows hosts with an OS X beta, and will run damn near anything as a guest, from OS/2 to FreeBSD. Binary installers for the 'free for personal and evaluation' use for XP and various free software flavors (including Debian, yay!), so you don't need a compiler to install it.

I got XP running on my Debian laptop in about an hour. This would be a very, very safe way for some of you to have surfing/email reading ability on an audio box. Install Ubuntu or Fedora Core (or better yet Debian) in a VM and run that with NAT for networking and you'll have a devil of a time infecting yourself. Or just get your feet wet with other OS options. Performance on GNU/Linux with the kernel modules is very impressive, don't know about XP but I'll probably try it tonight when I get home. It looks like they're even working on getting video acceleration to work.

TCBWhat a brilliant guy!

But musically, I keep waiting for something to happen. I think he has it in him, but the machines don't allow for much movement...

>Well, I have been really testing my system lately.
I have been putting a lot more time in in the studio
ramping up for some real customers.
Unfortunately I am very disappointed in the performance of my comp.
This is the first time I have really tried to record with the XP
OS.
I was planning on using Cubase as my mixing software and PARIS just as tracking.
That may be the way to go, but I just cant bring myself to leae PARIS. Ugh...

I have been riddled with blue screens during playback, Que errors, PARIS not closing all the way after closing it out(stays active in the task manager & doesn't disconnect from MECs). This is a brand new comp..the fastest I could afford at the time and it is running like crap with PARIS. CUBase seems pretty stable...actually everything else seems stable. Crap.... This is frustrating. I really don't want to suffer the embarrassment of rebooting the comp every half hour with a client. That would blow.

I am thinking about switching back to WIN98.

Shit!

Shit!

Shit!

Ok I am getting pissed off... I need to go and not think about it.

On a lighter note the recording is coming along at a satisfactory rate. I am pleased with what I have come up with thus far in regards to how my mixes are sounding.

It's really quite enjoyable..

I really need to get a FM transmitter so I don't need to burn so many test CDs though.

Configure your computer as a dual boot machine and use Win ME for Paris. It sounds to me like you've got some IRQ issues with the EDS card(s) sharing with either your video card or whatever else you are using for Cubase SX. Check your device manager so see how your ITRQ's are being shared. Paris runs nicely on Win ME, but it won't if it works any better than XP if you've got an IRQ conflict. . You're on the right track however. Tracking in Paris and mixing in Cubase is a dream come true.

Not to worry! you can get an IT guy to upgrade the Dell lap top with a video camera! LOL!

>James,

The Windows vibrator blows this thing away. It's called Windows Fista (I can't believe I just typed that!) and it's much more powerful. I've never had one in my hand, but here's some of the tech info. The clock speed is 30,000 rpm as opposed to 15,000, it supports a wider throughput, and allows for much greater peripheral expansion. It's also a full Gigabyte longer than the iDong. It only runs on XP right now, but the Vista Fista drivers should be out early next quarter. The hype surrounding the iDong is just another attempt by Jobs and company to get a rise out of the Windows community. As usual, Jobs is just flopping his "you know what" around.

Tony

Disclaimer: The above post was made in extremely bad taste and if I offended anyone on the newsgroup, I'm very sorry. I guess I'm just feeling saucy today.

I'm sure your right Tony, I'm sure the Window version really blows;) The
Windows Fista, looks soooo much bigger! But for the Hardcore Windows user
it would cum in real handy. It would really fit some of the real anal user.

Sorry, I couldn't resist either!

Just kidding around guy! Ditto on the disclaimer.

<http://saqqararecords.com/MiscAudio/FoxhuntRoughMixA.mp3>

NeilWell, I've never really been dissatisfied with my ASUS based native DAW but I've just about got Windows up and running on this board with an XP 64 4800 x 2 CPU. This system, without even being optimized for audio, feels significantly faster than my native based on an ASUS A8V-Deluxe mobo running an AMD 64 4400 x 2 CPU. I've also got an AMD 64 4200 CPU here that I was previously running in my ASUS DAW but didn't notice any huge performance gain when I switched to the 4400. Is there something significantly different about the 4800's? Maybe a different architecture or maybe it's the NForce chipset on the Gigabyte board? Maybe a bit of both? Could the VIA chipset on the ASUS board be a real dog in comparison? I heard some talk that the NVidia chipsets were much superior to others but I've never successfully used one before and since the ASUS DAW is fast and stable, I really hadn't been jonesin' for better performance. This new NForce 3 system system is a real screamer. Of course, the mobo is discontinued and hard to find. Another cool thing about it is the ability to manually assign IRQ's to the various PCI slots.
Stay tuned.

;o)Hey, I'm from eastern Montana . . . you're makin' me homesick. The stars get so incredibly bright when it gets that cold.

Sarah

Actually, make that 5 x IRQ's that can be assigned between the 4 x available
PCI slots (since slot 1 & 5 are hardwired). This might seem unimportant, but
it's not because my colorgraphics Xentera Quad AGP uses 2 x IRQ's and this
extra IRQ might provide some major flexibility in configuring lots of
variables.

.....anyway, I thought you Mac guys should know about this.

How do ou do this?
I am using an ASUS board as well.
I forget the exact model, but it is only a couple years old and is a DELUXE
model.

>Would 90ms really matter if you were streaming directly from Cubase to Paris in a mix scenario? As long as the tracks were being played back from Cubase SX with PDC using a VST>VST interface, the delay wouldn't be an issue because you would be applying your automation in Cubase, not Paris. The advantage to this would be that it would allow 24 bit transfers and would allow Paris to run on Win XP without the ADAT module issues or the 24bit>20 bit (inaudible) truncation. this would, however, require 3 x Magma chassis on one mobo. One would have the \$EDS cards, one would have the native system cards and one would have the UAD-1 cards. Paris will share with the UAD-1 cards, but not with RME or Creamware cards and neither RME or Creamware cards will share IRQ with UAD-1 cards. I actually have 3 Magmas here (2 x 13's and 1 x 7 slot) which are loaded each with the respective cards. I also have another 13 slot Magma here in reserve that I could use to achieve a bit more flexibility IRQ wise if the 7 slot unit throws me an IRQ wild card. I guess I'll have to try this with my new mobo and dualcore AMD 4800 CPU. wouldn't it be the **** if it actually worked? LOL!!!!

Stay tuned.

If this board is that much better, I may grab one to swap out with my A8V Deluxe.

This will become a farm system in a month or two anyway, but having some extra speed

and more flexible config wouldn't hurt.

Regards,

Dedric

>Dedric,

I will be running some tests here. My work schedule is pretty loaded right now so it will be slower going than usual. the thing I need to determine for sure is if this mobo chipset is compatible with my UAD-1 and Creamware hardware. Since I'm still summing in Paris, if the CW cards aren't happy, I've still got the 2 x RME HDSP 9652's and the Multiface here that I could try. I think it was Chris Ludwig who told me that this mobo was compatible with UAD-1 cards and I've had good feedback in my inquiries to Ali at Creamware about it's compatibility with the SCOPE system so I'm hopeful. I'll probably load up Cubase SX and my UAD-1 cards next weekend and see what happens. If this works, my A8V system will be relegated to farm unit status as well.

Cheers,

Deej

>I'm desperate to get Paris up and running again. It was working great until
I got a new 20" widescreen LCD about 6 months ago...

```

The new display meant a new graphics card that could drive the native resolution (1680x1050)... sounds simple.

First some background, my machine is a PIII-600E, 512MB RAM, Asus motherboard, etc. Old beast really but more than adequate for my Paris needs (2 x EDS1000) cause I primarily use the Paris DSP and not many plugs. Win98SE.

Problem: find an AGP card with Win98 drivers that can do 1680x1050. I bought some Asus card with GeForce but it's HIGHLY unstable. Machine freezes (fresh install of 98).

I could move to XP I guess, but then I'm up for more money than what the machine is worth!

Or, I'd consider a whole new machine. But I'm so out of touch with Paris compatibility etc, and not even sure if there's still any manufacturers making PC's with the right PCI voltages for the EDS cards? If there was a cheap Dell I'd probably jump in, and give my PARIS a boost of a long life yet.

Other than PARIS, I've been using a MacBook running Ableton Live. Nice workflow for fun projects.

So, am I dreaming or ? Worst case I could put my old graphics card back (a G400) and run non-native resolution to the LCD :(Some Aussie users have reported success with the Gigabyte K8Ns Ultra 939 mobo and an AMD 64 3600 CPU. I'm getting ready to test one of these with an AMD 62 4800 x 2 processor and 3 x EDS cards. the voltage is compatible and it would likely support your video card.

Here's an Aussie link.
<http://www.shopbot.com.au/p-11152.html>

I have e-mailed a couple of them tonight because I want another one of these boards and they are no longer available in the US.

Don't give up hope mate.

Cheers,

Deej

><http://alesis.com/product.php?id=106>
><http://alesis.com/product.php?id=105>There's Apogee Symphony, but it's mac. If you going to run it for audio only, what difference does the computer make if it will run your favorite software?

The only other PCI choice I can think of is M-Audio Delta 1010. Hook up four of them for 32 analog I/Os, four stereo SP/DIFs. You can have these upgraded by Black Lion.

http://www.m-audio.com/products/en_us/Delta1010-main.html

http://www.blacklionaudio.com/maudio_delta_1010.html

There are other choices, but they are PCI FW, or PCI Light Pipe

RME

<http://www.motu.com/products/pciaudio/HD192/>

Have Black Lion upgrade it.

<http://www.motu.com/products/pciaudio/24IO/>

http://www.blacklionaudio.com/motu_firewire_mod.html

There's Apogee Symphony, but it's mac. If you going to run it for audio only, what difference does the computer make if it will run your favorite software?

Now we know why. Now, in the spirit of bipartisanship, I'm going to go see if I can commune with a trout.

<http://www.frogview.com/show.php?file=883>Get mad anyway!!! I can definitely send you some so
you'll have a reason to
be pissed that you can't use them. ;o)

I agree that the moderators seldom showed up though, unless someone posted something that might lead them to believe that cracked software was being used. then they showed up big time. The "romper room" factor was large (good analogy). I never had the problems that some had with SX and did try to help a few folks from time to time, but the place was so ugly, I didn't post there much. That's the job of the Steinyfolk, IMO. BTW, from what I've seen,

the only DAW interface uglier than Pro Tools is probably Cubase 4. Did they get their inspiration from Tomb Raider, or what?

;o)

>Hey Neil.. Do a search on my Rant about the Middle ground DAW. Aka .the 3k-6k
Setup..Not to be found.

These so-called manufacturers are all(Like James M) has stated are only interested in the Bedroom, first time beginner to hobbyist market. It takes them off the hook of demand semi pros to pros.

Then, you have the BS#, so called Boutique audio market. Companies charging ungodly amounts of money for old designed that design to stamp a foot-print signature on you audio. Rediculous!!
For all the gains and strides we've made since the much coveted 1997(Paris's Birth on the market), we've seem to have taken 10 steps backwards.. Sad, really sad..

No Balls Namm.

[View Forum Message](#) <> [Reply to Message](#)

n't have any
noticeable loss of fidelity if I keep the overall mix level at

around -10dBfs and then strap the 5042 across the mix bus insert and crank the Neve line amps to make up the gain by around 8dB (I wish this thing had an option for incremental 1dB stepped gain on both the level and saturation functions) and follow it with a the UAD-1 limiter as a peakstop. The whole point of this is to see if I can get what I'm looking for sonically by using Cubase. I've got v4 on the way and if the control room function gives me the flexibility I need and my new Gigabyte mobo/4800 CPU gives me the horsepower, I'm going to make a pretty serious effort to start tracking with the CW cards on a native platform and see if I can live with it. The CW drivers function very well at 3ms latency and the new mobo has a Silicon Image SATA controller which should give me good read/write results from HD's during heavier track count projects. Otherwise, I'll just keep tracking to Paris. No problems there. I just want to simplify (gawd, I can't believe I used the "s" word)

I do have a feeling though that if this works, and me not being a synth guy and all, if I decide to go with a 100% native platform, it will be with one of the new RME PCIe cards.

;o)

>

>John,

I understand your frustration, but it isn't so much about defending the company as taking an objective perspective on what they really did say, rather than what a forum likes to think they are saying - SB did apologize, and were honest about the specific reason they weren't updating SX3 anymore, and it makes a lot of sense. I would do the same if I were in their shoes, except I would probably be a bit less tactful when the users whined like that on Cubase.net....phrases like "get a job, if you are old enough" or "call us when you are making a living with our product" come to mind.

If I worked for Steinberg, there is no way I would step foot on the Cubase forum. I don't bother there anymore. I've seen many professional users attempt to post logically and respectfully, only to get flamed for no good reason. You can't blame Steinberg or moderators. To clean it up would mean deleting 90% of the users registered there. Companies can only change their products - not the people who buy them.

Would the response be any different if they said "In order to release our last maintenance update for SX 3, we will have to delay the release of Cubase 4.1 and Nuendo 4 by 3 months"? No, it would be just as vehement and just as unrealistic. I read both announcements by Steinberg, as well as the announcement about Nuendo 4 posted this morning - all three are to the point, truthful and realistic. They aren't trying to pull the wool over anyone's eyes.

No offense, but it really comes down to deciding if you can get work done with what you have, or you can only work with what you don't have.

Nuendo 3 works beautifully here. It's paying my bills where worrying about an unfulfilled promise never will. If Cubase 4 doesn't suit you and SX 3 doesn't work for whatever reason, then perhaps you should consider upgrading to Nuendo 3.

Regards,
Dedric

>New Analog Mixers From Yamaha

<http://www.sonicstate.com/news/shownews.cfm?newsid=4042>

for laptop audio dsp/mixing

<http://www.sonicstate.com/news/shownews.cfm?newsid=4036>

RME Launch PCI-Express Cards

<http://www.sonicstate.com/news/shownews.cfm?newsid=4047>

gig-fx Launches The Quiet Cable With Quiet Button Technology

<http://namm.harmony-central.com/WNAMM07/Content/gigfx/PR/Quiet-Cable.html>

Don't forget the hot chicks and guitars:

<http://www.deanguitars.com/webcast/> I think these are made by Apogee, FWIW....at least SS was advertizing a

similar looking Apogee branded interface a few years ago. If it's Apogee, it ain't gonna' be cheap.

An RME HDSP 9652 with 24 Apogee/Mytek/Lucid, etc. AD/DA's interfacing via lightpipe would cover the 16+ AD/DA requirement for a "pro" DAW.

>Hey Neil,

About the XP stuff. A base XP install from an SPS2 disk only starts a few services, and you can disable most of them. And if security patches bother you, right click on your network interface and select 'disable' and you're good to go.

Not DJ but.

buss or general 2-buss work. The mix control is nice for parallel style work.

For crunch I like the Masssey Tape-Head, McDSP, Chandler plugs, UAD Fairchild, Sony Inflator and Colortone Pro all better than VW.

Genel actually love cubase 4 and think it kicks the snot out of paris but I do wish the moderators would take charge of their forum. I would.I already have them ALL. I am in love now though. The Princeton Digital Reverb Stereo Room / Vocal Chamber setting has stolen my heart. hehe

i agree about the beer thing. actually i think we use to refer to
strohs as fire brewed piss water. when i did beer it was usually of
the neighbor to the north variety.

You mentioned tracking in Paris and mixing in cubase...
are you just transferring the files between the systems or connecting via adat
and sending sub mixes or?

>BRME AES or MADI/AES, and 2 or 3 Mytek 8x192 A/D/A, or Lynx A/D/A. Heck,
I read that RADAR is going to release standalone converters too (from
Fletcher on Prosoundweb). Or if you want to spend less, get a few RME
ADAT interfaces of your choice and an Alesis HD24XR or two (for 24
channels at 96k). Have the HD24XRs modified by Jim Williams and they're
very nice for very little money.

All of the current solutions have drawbacks, though. If you want a real
tracking studio setup, you're still pretty much stuck doing monitor
mixes on a small console unless you feel confident mixing for headphones
in TotalMix, etc. I haven't tried using a Mackie Control on TotalMix
yet, maybe that would work well.

I guess this is where ProTools HD wins (or Paris in its day), the
integration of monitoring for tracking. Or is it something else?

BTW - if you want a more civil forum for Nuendo and/or Cubase, try
here: <http://aavimt.com.au/phpBB/index.php>

It isn't without opinions, but it's privately run, so there are no wrong
opinions. The main idea is to allow users to freely help one another.
It's getting there. Flaming really isn't acceptable there, which is nice.

Regards,
Dedric

Hope you are having fun at the audio toystore this weekend.

;o)Hey James.. Do a search on www.gearslutz.com on apogee symphony. I went toe
to toe with a Apogee guys disguised about the pricing and lack of features
vs the pricing..

I did not let Apogee just rest on it's "lofty" name. I feel I had a Big part
in this price reduction. To be honest, as I told them, I think the Symphony
should cost \$499.00 ..

Also, I blasted them for the whole Mac only thing..Just like I blast companies
for being PC only. Just stupid , and not good business (imo).. :)
Now, to answer mycompalints about Mac only, they are bringing out a Stand
alone version.

>Well you know what it feels like when some idiot gets in side of a company
and cancels Mac development, because he's a PC user. It has happened to
Mac users too many times in the past. Intuit canceled QuickBooks for the
Mac some years ago, boy did the president get blasted. The guy at the time
was actually sitting on Apples board at the time. Needless to say you can
now buy QuickBooks for the Mac again. One more reason Mac users get POed

when they are treated like second class citizens. Think about it.

You guys have the SSL product. What is wrong with that?

>Hi James,

The Symphony system is very cool but..

The PCI-e serves no purpose with out an external I/O box like the Ensemble or the option cards for the converters they have. The same way

MOTU 424 PCI card or a RME HDSP PCI card is of no use without the external box.

Also every pro sound card on the market can already do 1.9 or less at 96k why is that a selling point? Sound card from Lynx, RME and Sydec can easily do 96/192k at the same or lower latencies with all the I/O being used?

The tighter than usual integration with Logic is the only part that seems unique to me.

Maybe soon we'll start to see laptops with more than one expresscard slot so we can use the UAD and Symphony at once...sweet.

Chris

Because we want everything, and we want mass quantities of it and we want it
now. and we want it for nothing if we can get it.

>Heh. Why am I not surprised that Frank Luntz is involved?

[http://urbanlegends.about.com/library/bl_roswell_democrats.h tm](http://urbanlegends.about.com/library/bl_roswell_democrats.htm)

Anyway, bdays listed there:
Hillary Clinton: October 26, 1947
John Kerry: December 11, 1943
Bill Clinton - August 19, 1946
Howard Dean - November 17, 1948
Nancy Pelosi - March 26, 1940
Dianne Feinstein - June 22, 1933
Charles Schumer - November 23, 1950
Barbara Boxer - November 11, 1940

So clearly since this bunch doesn't qualify, there must be OTHER aliens wandering around, perhaps in positions of power...

Cheers,
-Jamie

>Hey DJ!!

Yes, That's our Chior and band (with) the DSO strings-All Live.!!

That (CD-DVD) project was from our second Album (Sony/BAJDA) called "Expecations".

The recording and mixing was done in house as well. Recorded to 64 tracks
-D88..Then X-fered to ProTools HD & Digital Performer for over dubs..

Pretty normal days work.:) Each week , we record live (multitrack) that's
then broadcast live via Satalite to other countrys. So, you really have
to be on your game.

On that project, I played Guitar, and worked both pre & post production.

>The Other day, I was just recommending the mixer/Cuabse as a really, really good setup.

Tascam has really doen a great job with their digital mixers. Sound wise, I have to say that they have more of a "Pleasing " sonic foot-print than the yamaha's DM2000 (Which I love)..

The verbs (TC0 are wonderful as are the Eqs and Comps. Last year, tascams have virtually gotten rid of every Bug they had with thier Firewire Interface..Tottaly cool!! 32 in/32 out via Firewire!! Amazing..

Then to add insult to injury, they include Cascading..!! Drop into and Argosy..Boom..

<http://www.argosyconsole.com/dm4800.htm>

Nice unit, for a nice price..

>Hello,

Are hardware samplers able to load multiple samples or loops that i can start or stop just hitting a multipad, i mean, sample 1 start = pad one, sample one stop = pad two, etc ...? do they recall the midi layout ? Is there something like "supersmarttimestretch" fonction, witch adjust the loop tempo with a given tempo, played on a pad (i guess no) ?

I've been reading specs from AKAI and EMU samplers, but i have'nt found the science (...)My DVD player is looking rather quaint.

In general, though, I agree. Google has simply done an end around on the OS/hardware vendors. Next up, cable/content providers. Personally I prefer google to all of the alternatives. As Scott McNealy famously said, 'You have no privacy. Get over it.' In that world I trust Google far, far more than I do MSoft or Apple or my ISP, all of whom have shown no interest in protecting my privacy.

interests at heart, esp. when their business model is to end around
antitrust laws to "own" all media transmission outlets by forcing smaller
companies to choose between them and bankruptcy.

Rupert Murdoch should probably watch his back as well.

You are right, Google is a train with no breaks... with the internet using
people of this world tied to the stop barrier at the end of the line. In
the end, we are the ones that pay the most for any company's greed.

Did you guys notice that they have imaged the entire patent database INCLUDING
ARTWORK with a ridiculously simple interface? The USPTO couldn't get it
done :-) I found and printed 10 of my grandfathers patents in approximately
5 minutes. Searchable content is what people want, and it takes enormous
computing power and storage to get it done. I think that's what the datacenters
are really about.

>Hi,

Regarding the latency yes u\you put it once and then on ALL other vertex instances (up to 128 !!!) get delayed for that amount of latency except for the track you manually put it !

Nice ye ?

I proposed him that and he just accepted !!

Well I kindly asked him if he could implement vst support for vertex on his subs !!! but he kindly refused cause this is not planned for the present....

Regards,

Dimitrios

Whatb preset are you using ??
I tried it but never quite liked it like the rest of you.
I prefer the stereo compressor for the whole mix where I can raise the volume
by its output quite enough !!

I hear you. Unquestioning following is a problem. We've been over the
cliff with both major parties.

Most recently with the abdication of oversight responsibilities by the
last congress, Republican controlled in that case.

Did you know the biggest "party" in Colorado, based on voter
registration, is independents?

Good sign.

Cheers,

That's the truth! You need to get over it though. You were pissed at EMU,
yet you have bought their products since and supported that company by doing
so. Think about it. I thought it was a bad move at the time too, but I

understand why they did it. They did, offered Logic user reasonable discounts to switch to their products. Time to put it in the past and see what's next.

>

>-It's Antiquated. Simple. It's not up to par with Pro Tools & Nuendo.

Yes, Logic has lagged behind in some respects, but it doesn't mean that it not a good DAW program. There has been continual developments. A lot of users like it's interface and have complained when they undated parts of Logic. I think they should have a classic mode for those users. I also hope Logic 8 is easier to use out of the box.

>I have much hope for Logic 8. I hear it's a complete re-write!!AMEN!!! New >Audio engine!! Yippee!!!! All new Look.. I got this info from our Sweetwater >via the Namm show.. :) :) :)

People are talking, but don't be mad if they are wrong. Don't be mad if this new version has some bugs, that's the case for most new software. There is no promise from Apple here. One thing is for sure, nobody will really know until Apple says so. Apple will keep developing it over time. My bet is, 64bit version, up to 192k. I would think they are going to try to compete with Digi, like they did with FCP.

massacre. The vast
majority of UK trade credits were used to purchase more arms.

1970s, Iraq purchased a French nuclear reactor. The US grumbled a little
but major US players were entrenched in the Iraq nuclear deal. The French
owned firm Areva NP acquired most of its technology and patents from Babcock
and Wilcox's, Westinghouse and GE (All US firms).

"Desert Storm" followed by a US trade embargo, including no food or medicine.

The first and second Bush administration!!! I don't think that model is sustainable. But even so, the
only real
protection artists and content producers have is self sacrifice - e.g. no
one produces if no one will be paying for it.

Of course that's a catch 22 for us, and no big loss for the Googles of the

world.

But it still costs money to produce quality content and that won't change much as long as the buying public wants quality.

Basically the advantage, if there is one, that artists have, is independent organization. The downside is that if Google controls the bandwidth, as some analyst predicted of AT&T and other large companies, they could shut out independent content all together with exorbitant fees, even forcing artists to pay to have their content sold by a content provider (with no return but name recognition) - in essence blackmailing the human desire to be "famous" or successful. Only large studios and record labels (after this balances out once again) would have the resources to promote artists and movies (i.e. pay Google), so the indie world will once again become a desert of guitar playing street corner musicians, and home movie producers hawking their art anywhere but the net. And this internet, once an information superhighway and free exchange of ideas, would turn into a corporate broadcast monopoly sold only to the highest bidder. At that point, we might not even have 3 major networks to choose from anymore.

Maybe that's wildly pessimistic, but any other model would require an altruistic mentality in the leadership at Google, at many levels, and for many many years to come. I have yet to see a corporate CEO with that mentality in any industry outside of Habitat for Humanity. We have become a country of bottom lines and profit margins, regardless of the longterm, or even midterm cost - make a quick buck and get out rich enough that your customers' or even your country's future is irrelevant to you.

It would take a miracle, or something on the other/bad end of the spectrum to change that now. Gee, I'm mister optimistic tonight.

Automatic figuring out of actual latency is a "impossible" task.

Although a plug-in reports its latency to the host, a plug-in cannot request
this value from another plug-in !

Thats why we are somehow doomed for automatic latency detection.

But this hand typing of latency for a single plugin is a great feature !!

>Hi,

Well this guy is willing to help us out with whatever benefits will arise
for him by buying his plugin...

Note that his plugin has a discount until 31 of January , around 46-47 \$
final price.

WE HAVE TO SHOW our appreciation on developers like him as we can ask for
further Paris support, like maybe wdm drivers ???

NOW he asks for some input from us.

Here is what he wrote on his last email...

To be flexible enough it is certainly possible to choose a much larger latency
buffer, but consider this: A buffer consumes memory, e.g. 65536 samples need
262144 bytes per channel (each sample is 32 bit floating point for VST).

If you run e.g. 48 (stereo?)-tracks with 48 instances of FaderWorks you need
 $48 * 2 * 262144$ bytes = 25 MB of memory. Should be no problem for today's
computers, but some users have Win98, so I'm not sure if RAM memory could
be an issue. If not, I would suggest about 132000 samples as upper limit
(needs about 1 MB per FaderWorks instance). What do you (or others) think
about it?Hi,

Well this guy is willing to help us out with whatever benefits will arise

-----=_NextPart_000_0196_01C73DCE.54F8FE70--Sorry,
 I wrongly pressed the wrong button here...
 Ok this was after my suggestion of high latency buffer for UAD1 and other
 dsp card users.
 I know that most of us have plenty of ram but if there is some other suggestion
 regarding this latency buffer and its upper limit please reply as soon as
 possible...
 Note that one instance of uad1 needs 16384 samples.
 So a normal uad1 user how many instances of uad1 plyugins does he use on
 a normal (or abnormal) situation ?
 His 132000 samples upper limit suggestion as you read on my previous post
 is an EIGHT instances of UAD1 plugs as maximum.
 Is that enouph ?
 Ok DJ please do not answer this :)
 If memory is not a problem , I for myself have 1.5 GB and use XP then I would
 suggest double of that 234000.
 What do ya think ?/
 Regards,
 Dimitrios

>Hi,
In order to propose a wdm driver construction to the Vertex developer I would
like to know if there is enough info available for someone to create that.
I mean codes whatever is needed...
Also if there is anyone that could spare for some months a eds card and a
maybe 442 interface because I guess that he probably would need that...
We cannot ask him to buy a set, right ?
I can ask him for a 64 channel wdm driver if the codes are available...
I remember Doug once told me that he had what is needed to make those drivers
except for TIME !!

Dimitrios,
I'm still liking it as much as anything else I've heard.
The grouping feature is just another plus although
it must be a pain to use - opening plugins etc..

Have you checked out Brian's technique of soloing within
a Paris editor? I never figured it out but he makes it
look simple like everything else..

Tom

"Dimitrios" <musurgio@otenet.gr> wrote in message =

Hi,
Automatic figuring out of actual latency is a "impossible" task.

Although a plug-in reports its latency to the host, a plug-in cannot =
request
this value from another plug-in !
Thats why we are somehow doomed for automatic latency detection.
But this hand typing of latency for a single plugin is a great feature =
!!

-----=_NextPart_000_01C7_01C73DD0.9ACFCCB0--Hi,

You remember Wormhole ?

Although there was a great support for us paris users regarding the update of wormhole I don't think that more than 3-4 of us ,including me, have bought wormhole.

I don't wanna be pushy with your money and urge you to spend them towards anything for that matter but you understand my position and how we Paris users show our appreciation to this author of Vertex...

We have to decide if we want some people get involved in developing Paris any further or let eventually Paris fade away...

I formyself I am here for me and all of you to fight till nothing can be done...

I will buy it because ALREADY is a GREAT plugin because you can SOLO a bunch of audio tracks along submixes , mute other and finally be able to do what clients sometimes (always ?) ask like can I hear please only the guitars ? or can I hear only main and backing vocals ?

Now add to the above this Latency compensation thing which was based on a idea of mine with manually giving the latency of a certain plugin and letting the rest of audio tracks follow that latency.

I am signing this:

Dimitrios BitzenisDear Tom,

No it is not that difficult as you think the soloing thing.

See how it works.

You have ONCE configure what tracks are to be grouped to whatever group 1,2,3,4...up to 32 !!

When you configure like drums group 1 guitars group 2 , keys group 3 , vocals group 4 ,etc... then you just have to open on only instance of the corresponding group set i.e open kick to solo all drums group , open solo guitar to solo all guitar group etc...

This solo in editor thing I guess is only for one submix right ?

This vertex though looks great too !!

So flexible can do more than solo and mute can do bypass and can fade volumes between groups with volume offsets !!

Needs some experiment and manual reading I guess.

Regards,

Dimitrios

Track 1 has a latency of 16384 samples. The same is true for track 2. As track 1 and track 2 have the same latency they are already in sync, but all other tracks (the remaining 46 tracks) have to be delayed by 16384 samples, not 32768.

Take another example: Track 1 has a plug-in with 16384 samples of latency. Track 2 has a plug-in with a latency of 8192 samples. What FaderWorks will do is: Tracks 1 will pass through as it is, track 2 will be delayed by 8192 samples and all other tracks will be delayed by 16384 samples.

What counts for the overall latency is the largest latency of any track. You calculate the sum of latencies only for individual tracks when you e.g. put several uad1 behind on the same track.

ISN'T that WHAT WE WANT ? !!!
If we don't buy this vertex we have to jump off Paris !! :)
Regards,
Dimitrios

-----=_NextPart_000_0073_01C73E01.CD10FB00--I don't think Google is especially greedy.
 They are a publicly traded company,
 their job is to make money for their shareholders, which they've done quite
 well. If smaller companies can't compete and Google cleans their clocks by
 providing better services, and does that legally, that's not greed that's
 good business.

Aaron,
I'll get right on it. I never cut them in the past.
That's why they never worked I guess.
Thanks,
Tom

"Aaron Allen" <know-spam@not_here.dude> wrote in message =
news:45b4cec2@linux...

Tom, it is simple. Select in the editor what tracks you want to solo. =
You can use control+k to cut at the time line if you have a specific =
section you want. With those highlighted, go to the Control 16 and there =
is a specific button for play selected it. That's it. Just undo your =
cuts once you're done here with a control+z.=20

Dimitrios,
I'm still liking it as much as anything else I've heard.
The grouping feature is just another plus although
it must be a pain to use - opening plugins etc..

Have you checked out Brian's technique of soloing within
a Paris editor? I never figured it out but he makes it
look simple like everything else..

Tom

"Dimitrios" <musurgio@otenet.gr> wrote in message =

Hi,
Automatic figuring out of actual latency is a "impossible" task.
Although a plug-in reports its latency to the host, a plug-in =

cannot request

this value from another plug-in !

That's why we are somehow doomed for automatic latency detection.

But this hand typing of latency for a single plugin is a great =
feature !!

That is what we want, but extremely high playback latencies will probably cause a delay between fader and mute actions and audible execution (and also delay meters). I need to make automation decisions with effects in place, so extremely long delays could be problematic.

Any chance we could pick from a list or assign a total delay?

Gene

This is exciting. Dear Gene,

The latency is determined on the plugins we put...

It does not matter if the highest possible will be 120000 samples when we use maximum of two uad1 plugins per track, meaning you can use 2 uad1 plugins across all your audiotracks if you have many uad cards for a total of 32768 samples if you use FXpansion wrapper or 8192 if you use Chainer wrapper !!

Even with chainer if you go up to 4 uad1 plugins in a row on a single track ,which is mostly unusual the total latency of the system with chainer will be 16384 !!!

Well with fxpansion is 4 times 16384.

I am excited ...

Note that for NON UAD1 card users like me (I sold them :)) we can use all these eds compressors with lookahead and nolimit with lookahead and compensate across all submixes for latency !

Also note that waves ren series introduces 64 samples.

T-racks great plugins the same 64.

Also we can compensate for the difference between eds cards ,14 samples and 2 for each thereafter in case you have more than 16 phase related audio tracks when recording...

I really love that.

I opened 64 instances of vertex with no cpyu load !

Very very light !

Regards,

Dimitrios

>I know what you are saying Thad, and in concept I agree, but my point is
that the US business model for "good business" is based on greed - e.g.
no limit or ethical boundary for making a profit "by providing better
services", faster or at a higher profit margin.

All the same I guess it's still just speculation. AT&T is still bigger than
Google, and they actually own a large portion of network fiber and cable,
and have threatened to start charging users per email, and for bandwidth (via
charging their leasees).

Google's market value (Forbes) is still only a paltry \$107B compared to Exxon at \$362B, GE at \$348B and Microsoft at \$279B. Profits vary differently, but as a general idea, they aren't much of an influence yet, other than finding keyword searches.

Worth watching I guess - I don't want any single company to claim ownership over the network we use to access the internet - eventually that may happen, and it could only result in us paying just to have this conversation (more than a monthly access fee).

>Well there is no pick from the list thing.
If you read all the posts you will understand that the latency is due to the amount you manually type on a ceratin vertex instance vst plugin. so if you put a 64 samples latent vst plugin you just type 64 and all other audio tracks get delayed that amount !
The author just asks how much would be the maximum possible latency needed because the 132000 maximum (only maximum if you will ever reach that) the author suggests uses 1 mb memory per vertex instance , so for 32 audio tracks with vertex 32mb will be needed, for 64 paris audio tracks with vertex 64 mb will be needed.
I agree with the author's 132000 samples as maximum ,if you will ever reach that I say again.
Normally you would never pass 1000 without uad1 plugins...

YES it will work under win98 and Me but "officially" there is no support for these platforms.

Don't worry though because he is helpful all the way.

hats why he suuggest maximum 132000 samples latency for win98 users who dopn't have large amount of ram.

Regards,

Dimitrios

>Great DJ,
This is the best answer to his kind efforts to even hear our cries for support
!
He is already planning the vertex update without even knowing if Paris people
will support him and his plugin.
I am very excited that a clever "manual" latency compensator will be usable
for parisians.
We just have to make a big latency table accessible to everyone where every
know plugin must be listed .
I will contribute for sure in this list.
DJ 132000 samples as maximum is enough for you ?
It needs to be configured from the beginning of the writing of vertex update.
Regards,
Dimitrios

Check into the Roland SPD-S drum pad. I'm using one in my live set-up and think it's killer. I prepare all my samples on the computer, load them on a Compact Flash card, then plug the card into the SPD-S. It's real easy to import custom samples and it comes with a huge collection of samples and loops. There are different ways to set it up, but I've got it set so that hitting a pad starts the loop and hitting it again stops the loop.

Here's are link:

<http://www.roland.com/products/en/SPD-S/>

>Hi,

I have a friend who has a control room with low ceiling in front around 4x5 meters and higher ceiling in back, it is build in a roof.

He claims that his Genelecs do not produce enough bass response as he knows that these monitor output.

Can this control room contribute in a way that it doesn't allow enough bass to be heard ?

I know the opposite and how you can solve that but lack of bass ?

Any tips ?

Regards,

Dimitrios Yeah, I use it all the time. Also has the benefit of hearing and effects you have on it in solo AND talent can hear the solo.

This makes for a very flexible solo function. If I'm tracking and I want

to solo and have the talent NOT hear it that way, I use the normal solo button.

If the talent wants to hear what they've done solo'd up I use the "play selection" method (al a Brian's technique)

What is the most recommended, least intrusive antivirus software for PC?
I hate Norton and want to replace it with something better for my net
laptop.

Grisoft's AVG Pro a good option?

I notice PCMag still rates Norton as one of the best, but my laptop runs
noticeably slower with it
(email takes forever to open, etc).

Thanks,
Dedric been using avg for years and it has stopped everything. i update the
definitions weekly on all computers. eff norton...go avg free.

> Oh well, more cool stuff for me.

Agreed. I had fun hanging at the PSP booth for a bit. The other guy sharing the spot was Stefano Daino, who sells DSP-Quattro, which is now my favorite two-track editor! Funny, but this guy was the developer behind Spark, which used to be sold by TC. I'm chuckling about that, as TC used to brag about German engineering, and Stefano is Italian! :-)

I think my personal favorite stuff (that I didn't know about before) at NAMM this year was the effects units made by Pigtronix! They have a phaser/envelope follower that is amazing! They're also coming out with a delay unit that uses the divine proportion (ϕ) to calculate echos...

Doug

<http://www.parisfaqs.com>LoL

Anyways

AVG and Nod 32 seem to be the least obtrusive on audio machines.

I still think that it is Norton that writes all the viruses!!

LOL. And at the least, they wouldn't have to - their software is already worse.

Thanks for the suggestions Chris and Rick, and thanks for the humorous interlude James. :-)

>Yes, rooms can really have a big impact on bass. I hope DC responds to
this post...

Try listening in mono to one speaker in the room, and have your friend
move the speaker. You should be able to find a position where the bass
isn't getting canceled out by the room. This can also vary by height.
Your friend may need to totally reposition the console/desk layout to
get it working. They may also need serious bass trapping -- but unless
a position change gives you something close to accurate, you're in real
trouble.

Good luck to your friend!

I think I understand the sentiment, but I wonder how many times you can reinvent a recording system - has the basic idea behind a preamp, a compressor or a recorded track changed much lately? I do see changes in the way recording technology is being used - I was talking to an engineer at NAMM, and he was saying that he has changed the way he works again to accomodate recent systems. I guess the earliest stage of recording was when you printed tracks with everything already on them, then you might adjust track leve

Subject: Re: (No subject)...What's up inder the hood?

[View Forum Message](#) <> [Reply to Message](#)

Is on the way back out, but other than that, the output was pretty much directly related to the input. Then we got to the stage where we could record dry tracks and really manipulate them on the way back out, especially with the big half-million dollar multi-channel consoles. Now though, with the current trends of down-sized studios, mixing in the box digitally, and having no computer hardware "personality", no headroom, etc, he was saying they try to record everything in the old way, with the best mics, preamps and effects on the way in...

While I don't see a lot of change in the basic ideas of pro audio recording, I really like what I'm seeing from sound creation people, for example Synful and Audio Impressions. Both of them are in the orchestral sound business - Synful is a two person show (husband and wife) and is very very impressive for how small the software is and how good it sounds, especially for legato lines. Audio Impressions has changed the way orchestral libraries are played - when you play a single note, an entire section plays that note. When you play two notes, half the players sound for each note. Three notes uses a third of the section, four use a quarter, etc. (Real divisi simulation...) Most orchestral libraries are samples of entire sections, which means one note comes from the entire section, two notes sounds like two full sections, etc.

I suppose you could argue that it's still "just sampling," but I've seen a lot of improvements over the old libraries that had one velocity layer and a single sample was pitch shifted over several keys. With more memory, not only can we sample each key, but we can have multiple samples for different

velocity levels. (Check out TBO from Sampletekk for example- it has 93 samples per note!) And with the new version of Native Instruments Kontakt sampler, you can now write program scripts to change how samples are played back - there is a really cool script for legato playing as well as a couple scripts to get rid of the "machine gun" effect that plagues repeated single notes.

I think innovation is still out there - you just don't usually find it at the big vendors...

Doug

<http://www.parisfaqs.com> Yes, clearly an effort by PC zealots to try to damage the Mac Platform. I wonder how much was created by these people. I've been virus free since 1994 when I started using Macs. There is no doubt that PC zealot hackers are gunning for the Mac, that web site is proof. It's really not a problem at this time for Mac users. What is there now, like a 150,000 viruses for the PC? The Mac has maybe 150 known viruses, and only a few are actually harmful. Mac vs. PC it's no contest! O/S 9 was even more secure, that's why are military would switch to Mac OS9 every time they got hacked.

So the military decided it only needed computing resources to make home
movies and download tunes? ;-)

R-i-g-h-t! Cool beans.

"Rod Lincoln" <rlincoln@nospam.kc.rr.com> wrote in message =
news:45b5044b\$1@linux...

Yeah, I use it all the time. Also has the benifit of hearing and =
effects you
have on it in solo AND talent can hear the solo.

This makes for a very flexible solo function. If I'm tracking and I =
wan't

to solo and have the talent NOT here it that way, I use the normal =
solo button.

If the talent wants to hear what they've done solo'd up I use the =
"play selection"

method (al a Brian's technique)
