(859) 635-5762If you need to interface with ADAT machines and/or are using multiple MECs
and wanting to use more than one ADAT card per MEC, you will not like Paris
on XP. If ADAT compatibility and using multiple ADAT cards per MEC isn't an
issue with you, Paris on XP is great, IMO.

ebay
scammer, this guy keeps posting a Mackie d8b, his location and user names

keep changing. He's been at this for a year. Check out all of his other items. He wanted me to pay him a lot more, and pay out side ebay. I've reported him in the past because he got threatening about his \$1000.00 shipping price, having me removed from ebay and leaving multiple bad feed backs on my account.

ebay still has not removed him. I wish more people would take the time to report guys like this so they remove people like this, and so the rest of us don't get screwed."Pete Ruthenburg" <

It runs with just as many bugs as it did with 98SE and ME only different bugs. :)

Actually it runs quite good. You should make sure that the machine you

are using now is able to run though.

Looks at www.musicxp.net for great guide to installed and tweaking XP.
Also look at the <http://www.parisfaqs.com/> for the right and only way to install Paris on XP.

Deej... please elaborate, specifically with regard to hitting
it hard in the SX channel - because from everything I've tried
in SX, one thing that I've found that consistently DOESN'T work
is to slam it... it just gets ugly if you're not below 0db, in
my experience.

Would really like to know if there's some SX gain-staging tricks that I'm missing.

NeilOK,

this is getting to be one of my favorite tricks:

Say I've got a DI, close mic and room mic on a bass cab. I lined'em up in the editor and check the polarity to make sure they are tight. Then I strap a Demeter tube comp across the room mic, a UAD-1 1176 across the close mic and a UAD Fairhamster across the room mic. Now I'm flying these to 3 x Paris channels. Depending on what kind of punch I want, I can clamp down on any/all of them in SX with the various comps and then either crank the gain like a mofo in SX so that there is a lot of response from the various comps (it won't clip because it's 32 bit floating at this point) and then attenuate the gain with the Paris fader on the corresponding channel so it's not clipping in Paris, or I can group the faders in Paris and attenuate all three channels that are being flown over from SX at very hot levels, or I can barely kiss the various tracks in SX to slightly level them off without doing much else, and then I can crank the bejeezus out of them in Paris with the faders, EQ makeup gain and Paris comps, using the Paris submix bus and Global bus, along with NoLimit to keep this from clipping the Paris mix bus and it just gets huge. Same thing can be done with any other track. The secret is getting it out of Cubase and summing it in Paris. As long as they aren't being summed there, you can mix hot in SX. The red clip bar is lit bright red on my Cubase transport on every song I'm mixing. It's just like sending tracks to an analog desk for summing.

be bringing it out
of SX before summing, because, and I can guarantee this, 32-
bit float-point or not, that if you hammer those channels in SX
and then try to sum it in the same app, you're going to get
real ugly, real fast (we're talking clip city, my bro-man.. I
hate to say it, but it's true anyway... it's pure digital, what
do we expect, right?).

So, are you taking the SX channels out individually, or are
you taking them out through an SX bus feed? I assume either way
you're going through your Multiface and then into Paris, right?

I think this is a pretty relevant question for this group, since
it seems to have become more of a sort of:

"FormerOrPerhapsStillPartiallyParisUsersWhoHaveSinceMigratedToCubaseSX "
group, as opposed to a strict: "ParisUsersGroup"

>Wait a minute, Geno... there's some kind of bigger issue between
WinXP and Mac OSX, I know that much, because I've got a backup
Firewire drive formatted for Mac OSX that contains ProTools
B'cast .wav files that I can't open in WinXP.

IIRC, you have to make sure that the engineer running Pro-Tools
from the get-go selects the: "Force PC Compatibility" option
when he either starts the project or backs it up - not sure
which... see if you can verify which one it is from some other
source besides me.

As I see it, from what you're saying, in this particular example, you're flying the hot signals out of Cubase, cranked to the bejesus, and then dropping the level in Paris. Hence, unless I'm missing something, your Cubase to Paris link is capable of exceeding 0db, is that correct? At one point you said "It's 32 bit floating point at this stage so it wont clip", which is fair in the Cubase app itself, but isn't your link between the DAWs simply some 24 bit integer ADAT links? Wouldn't they, therefore, clip? I would have thought they would have a threshold of 0db.

....or are you using some other kind of link? I know you've posted this a million times, but I always get half way through and get a headache. ;o)
I figure I'll just win the lottery and pay you to come over and set up a system for me. ;o)

If you can get above 0db signals out of Cubase into Paris... well for starters I would have thought Paris could only input 24 bit integers... but if you can get louder than 0db into the channels of Paris, that in itself opens up new possibilities because a normal Paris track overdrives at 0db. If you can go louder than 0db then Paris gain staging is going to reach a whole new level.

Cheers,
Kim.

I actually had a sound gig with four 802's a side...wasn't too bad, lows
were a little light but it had fairly good clarity and the band was doing

"hair metal" material

Don

Great players.

Very nice!

And yes. I also seem to have gain levels not theoretically possible when
using a dual-DAW setup.

>I'm going to be in the LA area (well, sort of-Ontario/Loma Linda actually)
tomorrow. I've got business there Monday morning but Monday afternoon and
Tuesday I'm going to probably be cruising some of my old haunts in the
Valley and Hollywood/West LA, plus snarking around for goodies for the
studio. Haven't been in LA since the early 70's.

If anyone wants to *do lunch*, or whatever, my cell phone is 970-769-0488.

Deej>Welcome Jimmy

I'll bet it's more likely top have stable power than this place. ;o)

Cheers,
Kim.

>Hey Rick, that's good to hear! Is it the new Intel laptop or iMac?

Is that loop test with Logic or with DP? If it's with Logic are some of those plugins soft synths? If some are soft synths have any randomly quit playing?

Apple's Logic tour is coming to Colorado in a couple of weeks and I'm getting way tired of that bug and gonna bring it up.

Anyway, it's great that you finally have a working Mac. Aside from the bug I mentioned with Logic, it offers a pretty capable environment.

So now that you have finally have a working system what's your next recording project?

Cheers,
-Jamie

>Heheh.....yeh.....very true. I'm actually going to be playing again pretty soon. I'm in the process of finishing up some mixes for a couple of projects here and then it's going to be time to start arranging/producing some of our songs (what I built this studio for in the first place ;o)

Tony Benson is going to have a few more of the premastered mixes from the ongoing project on his site tomorrow. If I hadn't figured out the PCI latency thing, I wouldn't have had nearly as easy a time with this stuff.

>Hi Tom,

The would shoot for the M-Audio or Edirol. The Emagic PC driver development/support is non existent.
