---= linux4330d791--First look at Apples support page for any info. <http://www.apple.com/support/>

If that doesn't help I'd walk it in to a local Apple store. They can do a diagnostic of the system and give you the cost of the repair. You have to log on to their site and schedule an appointment. <http://www.apple.com/retail/>

Good luck!

James

If you look at the left side of Figure 2A, you will see a typical modern balanced output circuit. Strapping pin 3 to ground will not give a 6db increase in output signal.

The 6db difference is the loss, going from balanced to unbalanced. Tha

>Isn't it the Studio Projects mic pre that has a tube which you
can add/blend into the signal chain in varying degrees? That
sounds like a better way to go if one is looking for a low-cost
preamp with a tube option... at least that way if the solid-
state portion of it is pretty clean, you've got that going for
you, and you can add in however much "ToOb" effect you want.
Heck, Drawmer even has one like that IIRC (but I don't know if
that one is a starved-plate design or not).

You know, I used to think that it was tubes that lent warmth,
but I recall a conversation on r.a.p. wherein Fletcher was
saying that it wasn't the tubes themselves, but rather the
transformers ("what you want is a big hunk of iron in there",
is how he put it), and at this stage, I would tend to agree...
for example, I have a Chandler TG2 pre, and that's not tube,
but it does have x-formers, and that thing does indeed have
plenty of warmth (along with a really nice high end, too, BTW).

One day it'd be nice to be able to quantify "warmth"... I mean
we all know it when we hear it, but what is it, really? Is it a
certain kind of distortion in the low-mids? Is it a slight low-
mid bump with a teensy-tiny little bit of high-end sizzle?
(personally, I'm leaning towards this one) Or is there a
certain narrow frequency range or combination of ranges that if
there's enough content in there relative to the rest of the
spectrum, we perceive it as being "warm-sounding"? (this one's
less likely, because if that were the case, you could EQ in
however much "warmth" you wanted). Like I said, myself, I'm
leaning towards the 2nd example... if you have Howard Stern on
the air in your market (not that I'm a fan of his, but this is
a good example of what I'm talking about) I think his
voice/signal chain is a good example of "warmth" - check it out
sometime if you're not familiar with the sound, or just tune
into his cable show...

If you are not a strong singer, IMO, you're going to have whatever else is around you in your vocoder at typical stage volumes. Probably the best mic I've had experience with in handling this best is the Crown CM-311 though that is not a wireless. I'd approach my local retailer and check out the best 3-5 models to try out and let him know you intend to buy one of them.

For warmth I think Rubber Soul. Combo of tape, tubes great mellow performances instrument choices. The vinyl version is very warm indeed

ROFLROFLROFLROFLROFL...

Oh My God - That's the greatest ever!

I am quitting my job and approaching them to be the PR guy for the group - they have BIG opportunities ahead and I want to be part of it.
