ad and type the io manually)video cache, set at 25600. This should get rid of the que errors, now render every track. Check to make sure everything sounds fine. Now put your config numbers back where they were.

I choose Polesoft Lockspam to fight spam, and you?

<http://www.polesoft.com/refer.html>I'm trying to find some instructions I think you put out a while a go,

regarding Paris sync to Cubase SX via ADAT and RME card. I think it was a Word-document. Do you still have it? My system is a little sluggish, I may have overlooked something in the set-up.

Bjorn RIf you are running a Hammerfall HDSP card, just set Cubase to sync to ASIO positioning protocol, attach a 9 pin serial cable from the Paris ADAT sync port out to the HDSP ADAT sync port in. In the HDSP control panel, set the HDSP to sync to ADAT sync.

Cubasse SX should now sync to the C-16.

>>I think though that someone could build a VST plugin that could work as delay compensator<

UAD has a VST delay compensator. The problem with it is that the delay it's compensating for is *HUGE*. This puts the audible sound so far behind the waveform that using automation is pretty much impossible.

Right now, I think Dimitrios has come about as close as we're going to get with this using his ingenious cocktail of wrappers and consoles. I haven't tried it yet, but if 90 ms (M?L) is possible and it's possible to create a 32-48 track mix template with this combination of VST wrappers, etc. inserted on each channel without too much CPU overhead, then this is major and pretty much puts the automation issues to rest. This could be very usable.

I've got virtually *zero* plugin delay working with Paris/Cubase hybrid rig, but it is neither cheap nor simple.

Dimitrios method could, in theory, allow a template to be created with a VST chainer which would allow multiple UAD plugins per channel running at the same latency and at the same time a compensator could be inserted in this scenario which would, when a preset is used, allow virtual delay compensation by simply nudging a Paris track 100ms to the left in the editor. This is much simpler than the hoops I'm jumping through with flying files back and forth between computers.....much much simpler. The only issue for me would be CPU the overhead created by a 48 track mix template with this stuff inserted on each channel..
