ree whole manual gears!! ;o) Rip through first (which took you to
about 15m/h on the original engine if you were lucky), then into second,
which took you to about 40 mile. If you were at 60 miles and needed to accelerate
you just had to press harder with your foot and wait for the little 202 to
wind up.

The last one was a "Kingswood" also, not a "Premier" like this new one. Premier
being the more expensive luxury model with A/C, a clock, and usually cloth
seats etc... as opposed to my poor old vinyl seats in the Kingswood which
were quickly covered all round in sheepskin.

I spent about 10 years in that car wishing I had a V8... now FINALLY...
;o)

Just had a look and the carby on this is awefully small... hmm... ;o)

Cheers,

Kim.

I tried several of your suggestions, and after saving as "acousticx2"
instead of using the original ppj, making sure my recording path
matched, and closing/restarting Paris. I now have little green blinky
lights on screen and noise coming out of those speaker thingies.

Thanks for the help, guys. That's why I love this joint.

pabhaving little green blinky lights and noise coming out of those speaker
thingies is a good thingA long time ago, I had taken advantage of the fancy-ass digital
printer/copier at work to print off the full Paris manual for both the
original OS and 2.x. Put 'em in nice, pretty binders with dividers

and shit like that.

Last winter, I stupidly left the hose on the faucet in my courtyard and the faucet split. I was going to change it, but wasn't in a real hurry because I knew not to turn the damn thing on.

Our condo handyman, however, didn't get that message, and when he came around to power wash our fence and solarium, he hooked up to my fauce

>hey carl,

yeah i've been to the site but i didn't see any specs on the jitter
rate...ie..10-20 picoseconds etc. i was hoping that the unit shipped
with a spec sheet as to it's stuff...wow, there's a technical term.

thanx

Off to Sri Lanka in a few hours. Spicy gig at the Columbo Holiday Inn. Clocking issues exhibit some mighty strange symptoms when two computers are interfaced digitally. One thing I found after trying 6534785465 different scenarios was to clock all of my MECs from the master WC, then run 9 pin sync cables from the MEC ADAT modules to the sync ports on the RME cards.....and *never* to hook up a WC cable to the RME cards when they are synced to Paris ADAT. This seems to be the most stable solution. The downside of it is that everything is dependint on Paris being booted because if the clock is being regenerated by the Paris ADAT modules, then even to run Wavelab on the native DAW, I have to have the Paris DAW up and running. I can just turn on a MEC and it will generate ADAT sync, but it's always 48k unless the Paris app is also launched. Not a problem at all as long as I'm sticking with 44.1-48k sample rates. If I want to record at 96k, I just distribute my Mytek clock to the RME cards, terminating the BNC outs on each RME card or I can use the RME clock and just daisy chain the RME cards, terminating the BNC output on the last card. How often do I use 88.1 or 96k???.....well.....just about never, but if I'm going to advertize that I have this capability, I need to be able to pull it off once in a blue moon. I require my clients to provide their own 250G drive (formatted) if they want to record Hi Rez. This usually makes them reconsider.

Glad you got this happening Jeremy.....and as far as credit where credit is due, you can thank others as well.....Gene Lennon, Brian T, Mic Cross, Dedic Terry, Aaron Allen, Morgan Pettinato, Chris Lugwig, old weird uncle Rick and I'm sure the list goes on and on and I'm leaving out some folks. All of these Parisites were instrumental to whatever success I have had in putting together my little monster here.

;o)

>I would add that I first saw a Paris system on a visit to Tommy's studio a few years ago, and seeing and hearing that proved to be the incentive to buy my own. What followed was email after email from me asking for advice, how do I do this?, why doesn't this work?... ad nauseum..

Tommy showed an amazing amount of patience for the endless barrage of requests, and helped me immensely.

Truly a class guy, not to mention extremely talented... A nice combination.

from the Paris mec, and I ALSO have word clock running to it from the GenX,
as well as the GENX clocking 2 Paris Mecs and a 442 that I got from some
guy ;-)
I have had zero problems with this so far. I think I'm doing that because
of an old post by BT that basically said the clock passed from the adat cards
wasn't that good. But I may be remembering it wrong. Anyway, I've had it set
up that way since I got the word clock, with no problems. Weird.

I choose Polesoft Lockspam to fight spam, and you?
<http://www.polesoft.com/refer.html>So.... I wrote to Hosa, and got this response back within an hour or two (which I find very cool)..... I was also sent a pdf, which basically says the same thing.

Carl,

The WDC-427 Word Clock Generator is Clock-accurate to +/- 10 ppm. See attached cut sheet.

It is also rack mountable by using our model PPP-000 19" mounting frame which will hold a total of four Hosa Modular Series units, including a fiber-optic patch bay, a fiber-optic splitter, an XLR patcher, and balanced and/or unbalanced 1/4" patch bay modules.

More info:

<http://www.hosatech.com/hosa/products/WDC-427.html>
<http://www.hosatech.com/hosa/products/patchbays.html>
<http://www.hosatech.com/hosa/products/PPP-000.html>

Please let me know if I can help further.

Regards,
LW
Hosa

All the best to all,

Tommy"

Man, if that is hacking, I'd be proud to be a hack... :)

It's kinda interesting that steel players have taken to the platform--Mike Smith, who I can lay a damn good argument for being one of the 3 best in the world--Tommy, a serious world class player--myself, who ain;t too bad either--and Bill Terry, who I have yet to hear, but hear good things about.

Any other players out there?????

>Rod,

I remember that post by Brian T. and that's precisely the reason I was doing the same thing. I had constant freezes/lockups until I disconnected the WC cables from the RME cards and just used the sync from the MEC. I think I know why this is happening though. I am using sync from three separate ADAT modules in three separate MECs running to three RME cards. Each MEC is being sync'ed to the same WC, but there is some latency in submixes between MECs.

I wonder if this causes sync problems when the RME cards are synced to both MEC ADAT and WC. there are some variations I could try, but I really hear no difference whether WC or ADAT sync is used since the ADAT sync that Paris is sending the RME cards is just sample accurate sync generated by the ADAT modules relative to the WC.

Regards,

Deej
