If you have your amp REALLY loud then you can push your submix faders up moderately with the master pulled down and then you can push the submix faders to make sure you are not just trying to get volume gain.

Keep pulling the master down as you push submix faders up. This way you'll get the volume you want and will be listening to the sound and not trying to just get it louder.

This makes it easy to hear distortion. Then, turn your amp down and push your masters up to distortion and back off a bit. Of course meters are selected post fader here.
