>Dear Rich,
I don't see the point why not use aux to send to a compressor stereo setting
at pre and nulling the faders, then you can send all you drumtracks into
the same compressor or Nolimit and either use the return trimmer or use in/out

wires to send the aux back to a Paris audio track and then use this with fader (automation etc) and eq for your drumtracks compression.

If you use compressor with 0 lookahead you will have only 2-4 samples latency on all your drumtracks.

>I wonder if there could be a string line like EDSPriority=1 (does not apply this) so that the flow would be first EDS processing and then DX...

this is to be able to use DX effects on auxes !!

Can anyone guess try several strings there ?

I think that it could be done to let Paris read DX effects after the eds processing, well who knows ...

regards,

DimitriosIvory may be able to use it but I would be curious what your actual RAM usage is when running Ivory, and if you are using the /3G switch to access above 2G, or if it just stabilizes Win/Cubase when using over 1.2G.

WinXP limits apps to 1.2G. With 2G, supposedly the /3G switch also bumps the 2G usage to 1.7G for apps, and of course is supposed to open up 3G usage. Nuendo has issues above 1.2G that cause instability, corrupt projects, etc, though there is an error handler in Nuendo now (I assume Cubase too) that usually allows you to save your project to a new file if it detects this problem. It is an annoyance, and can be problematic with large sample libraries (orchestral here, using NI's DSD, so it may not be as much of an issue with piano libraries - single instrument, different streaming technique, etc).

Regards,

Dedric

> You can do this. Use an aux instead. If you have an unused EDS card, copy
and paste your mixer settings, copy drag your drum tracks to there, select
prefade on aux 1 for each track, mute each track, select NOLIMIT or the eds
compressor. All you will be hearing is the compressed sound on that submix.
Note: you will have to compensate for latency between submixes, and for the
eds effect. You would have to do this, even if there was a way to strap an
effect across a submix.
Submix latency varies from system to system but is "about" 12 to 14 samples
from card A to card B and 2 samples per card after that. Latency for the
eds comp with no lookahead is 2 samples, No Limit is the same. On no Limit
you will want to use lookahead of about 25, which means nudge back 1 ms and
apply 53 samples of sampleslide.

for my Cubase DAW if the build using the K8V-Deluxe went badly. Now that
I've got the K8V native DAW properly configured and it is flying along, I'm
wondering if I'm up to building and configuring another native DAW any time
soon. Unless I feel I have need of this board I may just hold it in the
wings in case, for some reason I want to upgrade my Paris DAW or build
another one. I think it would be fun to sync two Paris systems together
US
