while. I must admit that PTHD system with the new controller looks nice, but for \$18k plus the computer to run it, I think the MADi running on Cubase 4 with a bunch of UAD-1 cards is a mighty nice alternative.

I may build myself a little bit heftier computer just to insure enough

horsepower when dubbing projects that already are at fairly high track counts with processors loading the system down and call it good.

I wonder if there are any mobos with PCI slots that will handle Intel quads and are compaible with UAD-1 cards.Hi Dj,

>I wonder if there are any mobos with PCI slots that will handle Intel quads

oI So here you goes, all Parissite-fans of Macle:

<http://www.themateswebsite.com>

You candownload mp3's and buy the fantastic CD too, so I ordered 3, for me and fans here in Norway:-)

Erling

ols users were mac users. Pro Tools saw
the exact same CPU horsepower difference btw Mac & PC as we all witnessed
the last 8 years.

It's not talked about because, MAc folks are just that Mac folks.

eir newer

plugins may be good, but a good many are quite out of their league now and hardly compare to even some freeware plugins, much less quality commercial plugins (UAD, Voxengo, Sonalis, Flux, etc).

I'm all for preventing piracy, but imho, some companies are just trying to make a point and a buck rather than actually solve anything. The phrase

"biting the hand that feeds you" comes to mind, even if it's an indirect result of trying to stop thieves.

Just my .02

ntical machines and linking them via Steiny systemlink. I did some more critical listening last night and decided that I will stay with ASIO direct monitoring after all. Even 1.5 ms latency (along with the appx 1.5 ms inherent in AD/DA conversion) is audible enough to my ears to leave a bad taste in my mouth. I'm going to wait until things sort themselves out to the point where I can run flat out at 32 sample buffer settings (which are actually using 64 samples with the RME cards). That will get me below 3ms "true" latency and that's something I can live with. Unfortunately, my Opteron 185 will choke at 32 sample buffers when track/plugin counts start climbing.

Using ASIO direct monitoring isn't a problem the way I've got things routed right now. I'm splitting off the headphone out

Subject: Re: Motorized faders - touch sensitive or not?

ings and I'm good. It's like being able to use the Cubase CR function with ASIO Direct monitoring enabled. The only limitation is not being able to monitor plugins on tracks being recorded, but that's not an issue really. I use hardware reverbs on the send/returns of each Furman HRM 16 remote mixer so each performer gets to dial in his/her own mix anyway. Sweet!

help with this.

OK so for the first time I decided to try a project using
nothing but VSTi's, so I loaded up DHF2, set up a GM Drum map,
and started programming a few measures. Fine.

Next I loaded in a softsynth & started programming a few bars
there, but I couldn't get it to sync with the drums. I had
latency set at .7 Msec, so that shouldn't have been the
problem, but even when I manually moved/quantized stuff it
still was off a bit. SO, I turned off the drum mapping on the
DHF channel & lo & behold the quantization on the drum mapped
editor vs the non-drum-mapped editor was off! Next, even when I
manually edited the (now) non-drum-mapped drum rack to the
right quantization points, it wasn't syncing right - IOW the
beat was off a bit here & there.

I had the tempo track activated & everything, so I dunno what

could be the problem. Normally I program everything on my
Fantom & import the MIDI files into SX in SMF-1 format &
everything syncs up perfectly... any ideas WTF might be going
on or if I'm doing anything wrong????

NeilWhile you were gone the Paris NG computer rebooted itself and when it
came back up, it spit out the secret to life and the universe...

It's gone now though...

DC

where'd you go??

I think I know which moment that was. I was under the shade of a tree doing a painting and smoking a peace pipe when suddenly the truth of everything appeared before me and I was one with the universe. I telepathically beamed my vision to multiple locations (including this server of course) before receiving a sudden pang of pain which seemed to have a psychic relationship to the words "Memory Exception Error in block FFE3 2B1A" at which point I suddenly found myself falling off my chair, narrowly avoiding painting my nose green in the process.

>It's gone now though...

Yes, it has. ;o)

>where'd you go??

Northern NSW. In particular Byron Bay, among other, err, similar places.
;o)

Cheers,
Kim.

>Neil,

About the only thing I can think of is you may have emulated midi ports active instead of the direct midi ports. Check under devices/midi and see what in/out ports are active - you shouldn't have "Emulated..." ports in use.

In early versions of SX, you had to move an ignoreportfilter file into the main Cubase directory to shut off emulated ports, but it was setup that way automatically in later versions.

What midi interface are you using?

Dedric

old to get the fingers to remember correctly;-)
I owned the combination in the early eighties. Two boxes, one with all
kind of delays and harmonizings, the other with all kind of reverbs.
One of the boxes get the digital power from the other with a thin
cable.

flawlessly on a PC as well as a Mac. But, up until the current crop of mac
(Intels), the PC ran circles around the Mac running Pro Tools (Any version)..Now,
it's a wash.

As for Mac version being more stable. Nope. The Mac verison will crash on
Pro Tools just as often as the PC version. My personal experiences have been
that Pro Tools on OS9 was very stable..Not so with OSX. Iwould say that PT
on Win XP is more stable than OS-X and more robust.

>Thanks Dedric, I setup the K-14 using the -20dB pink noise file from Bob
Katz site with +6dB trim added to it. I set one monitor to 83dB and together
they measured 85 for two monitors. When you add two monitors is it 2dB or
3dB? I always read 3dB but the measurement is showing 2dB rise for a 2nd
monitor.

My understanding of the metering system is that you really don't need to
use the meters because it will be too loud if you get anywhere near clipping.
That's where I'm confused because 85dB average signal is not LOUD it's just
what I call medium loud. It's a great volume for monitoring but I'm not
understanding the statements that it will be way too loud. I'm able to meter
out my mix on the K-14 metering system in my RME Digicheck and some other
meters also so I know the level is correct. Since I'm doing pop music K-14
makes sense to be using it but my understanding is that peaks will be at
99dB (+14dB from the 85) and that will be way too loud. Well...I'm getting
my meters at 0dB on the K-14 meters and nothing is blowing me out of the
room.

hmmmm

Am I doing something wrong? Just a guess: Make sure, in the device setup, you have "Use system timestamp" clicked. That can really screw with midi timing.

>Have you guys & gals seen this new SSL software product that will convert
any session (EDL) into another format DAW session format.

If this thing works, this could be big?
<http://www.sonicstate.com/news/shownews.cfm?newsid=5384>SSL bought it from CuiBonoSoft - it
was EDL Convert Pro. Works great for
converting
EDLs, OMFs, etc (I use v4 - it's a lifesaver). The word from a v5 beta
tester is that it does in fact convert PT7 projects to and from Nuendo XML
and works very well.

The support for PT7 transfers is the new feature to v5 that could be a
really big deal. Previously, due to Digi's lockout of
PT session formats from 3rd party developers, you could only go back to PT5.
Either CuiBono figured out 7,
or Digi sees the writing on the wall about customers' desires to move
between platforms and opened up the format
to CuiBonoSoft/SSL.

It's also now twice the price it was, but still worth it.

Regards,
Dedric

The Mac stuff is built under Code Warrior, not visual C++. It's a real nightmare, and if you think it was hard to grok the Visual C++ side, think about doing it with no reference projects. Yikes.

The sum is between two monitors may depend on placement, reflections,
etc, but yes, it would be 3dB in most cases, measured at the center mix
position.

>
> My understanding of the metering system is that you really don't need to

The idea is that music that is, for example, -9dBFS average RMS, will sound
really loud in K-system.

Bob even recommends actually using K-20 even for pop. K-14 is fine until
the industry adopts a wider
dynamic range (in 5.1 K-20 is just right and sounds way better than
compressed stereo).

> out my mix on the K-14 metering system in my RME Digicheck and some other
> meters also so I know the level is correct. Since I'm doing pop music

> getting
> my meters at 0dB on the K-14 meters and nothing is blowing me out of the
> room.
>

That sound about right. At 0dB on K-14, you are 14dB below 0dBFS. I also
assume you are using Digicheck for metering -
also be sure Digicheck is set for RMS levels, not peak. When you run the
pink noise test, with Digicheck set for
RMS (ASIO outputs, not hardware), the pink noise test should register 0dB on
both channels (with your master buss at 0,
Control Room at 0, Totalmix at 0 on the ASIO channels,, and whatever level
is needed on the output channels along with your outboard monitor gain).

Put on something like No Doubt's Rock Steady CD, or anything with an average

RMS of

-9 to -11dB - it should sound too loud when monitoring with 83 db SPL (esp. at K-20)(The average rms is -9 to -8.5dBFS on most songs on Rock Steady). But I would advise starting with a lower monitor level, and working up to your 83db reference to see how loud it really sounds - it will be well over 83db - probably around 95-100db SPL.

The idea is to get us out of the loudness mindset and back to mixing with dynamic range, and hearing subtle, quieter detail in the process without the ear fatigue that is associated with mixing for high average rms levels.

With rock/pop, you want your average levels around 0 on K-14 with some pushing yellow, but few peaks in the red. You shouldn't have any levels sitting in the red with K-14, but guaranteed, most over compressed pop CDs will sit in the red.

Regards,
Dedric

>

> Am I doing something wrong? Hey Dedric, I too thought that it could not convert PT7 sessions, but as we

just witnessed from Sonistates's video, it does convert PT7.. That's a break thru HUGHED!!!! And, that levels the playing field for alot of studios.

support interleaved, but it also splits interleaved files.
Not EDL Convert's fault - just a legacy spec issue that is only now, slowly
being recognized as such.

>Possibly because in the past this was a newsgroup full of Paris fanatics who
were fiercely denying any notion of Paris being obsolete and were still sharing
experience, strength and hope for the future of their favorite DAW. Now
it's a newsgroup full of former, soon-to-be-former and eventually-to-be-former
Paris fanatics who hang together because they just like each others' company.
I suspect that info regarding possible future paths for all of us still
using Paris as our main DAW would be seen in a somewhat different light at
this point in time.

the rest of the weekend in a stinking hot recording room doing Monkiedrums.

So then, I now have six tunes to edit.

In previous experiences doing this lovely task I have manually edited all of the kick/snare/tom mics instead of using gates to get rid of extra sonic trash bleeding through from the rest of the kit.

First, do you folks who work a lot with acoustic drums usually do this? If not, do you do something else?

Thanks,

TCBI'm almost embarrassed to post this but the "kick" preset on UAD-1's Neve 88RS plugin has such an efficient use of gating, EQ and compression that just dropping it on a kick absolutely transforms it into something

altogether different.....and different in a good.....err.....no, not good.....great way. Drumagog is also your friend in this situation and using Drumagog BFD with the Neve 88RS...well.....anyway....

;o)

Of course, the company was beyond comparison. I'm not sure if there were more of us Paris users or not present, but that really didn't matter. The conversation was plenty lively and covered a lot of bases.

Sorry you missed the fun, Thad. I can understand being stuck at work. Hope you made it to the show on another day.

ight up to the beginning of the first hit,
then fade out the last hit in no particular length, just as
long as each fade sounds natural.

When I'm working with real drums, then I'm definitely going to use the "organic-ness" (organosity? organisiousness? organitude? :)) of the atmospheere of the whole kit, which includes a certain amount of leakage. Now, I will admit this much: back in the late 80's/early 90's I used to gate the shit out of drums, because there was a certain discrete sound that came from doing that, but I don't do that anymore.

Actually, Thad, I'm kinda surprised you'd even consider doing that (editing or gating), I kinda thought I recall you mentioning you had a lot of taste for the lo-fi - if that's the case, then the more bleed, the better, usually.

Check. Only exception is when I get a weak performance/drum under a mic in the snare or kick dept and the bleed is just too much. Not often, but has happened and I usually have to edit the 'non' hits out and trigger a sample in these cases.

> When I'm working with real drums, then I'm definitely going to

Yup, we agree on this process, but I might also add that it really depends on the player, the kit, the room, the mic placement and the song as to what vibe I'm batting for. Gating is the lazy way to fix those kinds of things (and the sound suffers for it IMHO) that should be attacked manually to keep a real kit vibe going. If you're going after the Phil Collins thing, well then gating will be your tool of choice. retriggerin' samples off a sloppy kit can get pretty sketchy, and you're fairly well assured to kill any finesse or ghost notes, and that is where the vibe lives, again IMHO. I've never dug gates, and in the 90's I had some DOD piece (single rack, 4 'gates') that allowed leakage via potentiometer using DBX VCA's in it. Jeez, I wish I still had that thing, you could dial up the 'organic' right there on it but control the bleed factor.

Happy editing!

>Believe me, Neil, If had a great sounding kit in a great room I'd do everything
with five great mics and wouldn't edit a thing. But to steal a line from
the Donny Rumsfeld Quote Book you don't make a record with the drums and
room you want, you make a record with the drums and room you have. In this
case I'm fighting the room (a lot) and the kit (a little, it's a Yamaha Recording
Custom kit, good drums but not stylistically perfect for the sound I want).
Lastly, the Monkees tend to layer it on a bit when it comes to guitars/vox/keys
later on, so I'm sure we're going to be going for much more of the spot mics
than I would like given my own stylistic tendencies.

I'm trying to be flexible with these guys. I have my own (very strong) opinions,
but even though I'm kind of in charge of the recording I think I have to
respect the ideas and sonic preferences of the whole band. We even used a
click for the drum tracks because the drummer actually likes to record
with a click.

Favorite drums I've ever recorded were an old Ludwig maple kit that had what
I swear were bullet holes in one of the toms. I got to use a huge concert
hall at Yale and tracked with two Octava overheads, an SM-57 on the snare,
I forget what kick mic, and a stereo pair about ten rows into the hall for
ambience. This time I'm recording in a 14x12x11 room that is on the end of
someones garage. A slightly different animal I fear.

Thanks for the tips, I think I'm just going to do what I did before, even
if it is pretty time consuming.

e for real fun.

"It's going to be such good times," one blogger wrote after Moore published

saturation (some predict 14M sold by end of 2008,) a mesh networking application (or something to cross-connect the myriad of networking options) and an attractive application to encourage the owners to share amongst each other (say, some funky music sharing application or social networking tie-in, or instant messaging.) That'll lay the ground work for some very effective malware."

For his part, Moore said in his posting that he's added support for iPhone executables to the msfpayl
