are all there and working like a charm. I  
did loose my AutoTune but then again when I have used it in the past it was  
always within Wavelab. Steinberg did add nice new plugins to the mix.  
They've always had the "cheesy" reverb, delay and compressors but they've  
revamped them and with the little I played with them last night they are not  
half bad.

I also loaded up a few of my SX3 mixes and noticed the CPU performance was  
improved. One mix I had in particular used to really push my CPU usage but  
after opening it in Version 4 I noticed the CPU usage was dropped.

Interesting, and inexcusable.

Firewire with the Motu 828MII is rock solid here on MacOSX and has been for the last several years.

>>I beleive that everything IS in fact measureable...but, that our ability to  
know WHAT to measure is te limiting factor. Our specs like THD, TIM, etc  
don't tell us what 'sounds best'. If differences will show up in our 24 bit/96kHz  
orginal tracks, and in the 16 bit 44.1kHz CD mix, then they were in fact  
measured. The problem is, we don't really know what distortion spectrum is  
euphonic versus harsh.

I think Ethan is out to lunch with his comb filtering argument...yes, its

a real effect, but its also something that when kept under control our brains can easily smooth over. Think about it, if his arguments were true, you'd never be able to mix a song as our reference position is always changing.

Cheers,

Kris

I like it, My live rig consists of lots of Boss pedals and a few assorted other things and I cannot see me incorporating the MS into my live set up, but I quite enjoy having it to jam with for practice if I don't want

to break out the live rig.

I could see more use for it in the studio than live.

One complaint,

It would seem the output levels vary quite a bit from patch to patch.  
I don't understand why they wouldn't be a little more consistent  
right out of the box.

sound more compelling isn't it?

Look, we don't want our profession to simply amount to a bunch of  
voodoo. We want it to be quantifiable and scientific, and to a great  
extent it is. But, I remember when the first high-end speaker cables  
came out years ago, and most engineers guffawed loudly at them,  
but quietly, as more of us listened, we found some of these cables  
made a real difference (and some were complete crap) In the 70's  
it was not uncommon to have well-known and respected engineers  
saying that there was no difference between high-end cables and  
THHN electrical wire, Romex, or lamp cord. No one says that any  
more. We have found that some cables indeed increase detail, and  
it most certainly is *\*not\** comb filtering, since the difference is  
apparent and profound no matter where you place your head.

Now, the phenomenon of people expecting some high-priced  
doodad to sound better, and so it does, is real indeed. But so is the  
phenomenon of some

tin-ear Mr. Science wannabe claiming  
something isn't there because he cannot measure it or explain it.

It is just as silly and incompetent to convince yourself that

something you hear is not there as it is to convince yourself that something you wish to hear IS there.

So, how do we know the difference? We develop a hypothesis, attempting to isolate the phenomenon and its possible explanation, and design an experiment to understand the phenomenon. Sometimes we succeed.

Years ago, I bought a Nordost AES digital cable to use between an A-D converter and a DAT. I did not expect to hear anything, but my friend who sold it to me was so excited about it, I got one on approval. Well, it made quite a difference in small-signal detail. (when the orchestra plays soft passages) and on other areas as well.

How could this be? Hell, the conductor heard the difference, and one of my mentors, a Ph.D in the physics of sound (who poo-pooed the whole idea) changed his mind at the first 3 seconds of music.

I was so annoyed at this, that I called Nordost up and asked what was going on. They actually told me. While they claim some small improvement from the silver conductor and all that, they then asked me how long the Canare digital AES cable I was comparing the Nordost to was. 1 foot said I. Well, they said to make up a 10 foot Canare cable and compare the short one and the long one. Turns out that most of the improvement from the fancy cable was due to the extra length (it was about 4 feet as I remember) which Nordost attributes to reflections in a too-short cable. I could hear no significant difference between the 10 foot Canare and the Nordost BTW, and I never bought another Nordost digital cable.

So, no all the high-end cable folks are scummy!

We simply can hear things, at times, that we cannot yet measure.

While this severely complicates the world for those who want it nice and simple (you mean some of that actually WORKS??, oh-hell, now I have to figure out which works and which doesn't?) and it opens us up to charlatans, it is still superior to either the ignorance of the high-end voodoo salesmen, or the self-imposed ignorance of those who cannot find a phenomenon on their present equipment, so dismiss it.

I was analyzing a mic the other day, and it wanted to feedback, really bad, about 8K, but the analyzer showed nothing. So, I switched the analyzer from 1/3 octave resolution to 1/12 octave and bam, there it was. A narrow band spike in the freq. response.

Now, if this was 1982, and all we had was 1/3 octave analyzers

should I have claimed the spike wasn't there, even though the feedback that resulted from it almost tore your head off?

db,

I see the same issue with my Line6 modelers. Lots of variation between patch volume levels. This was a big problem for me until I figured out a workaround, at least for Line6 stuff. I use a PODxt in an Atomic tube amp for my live rig so it was especially critical for me when going between clean and distorted tones.

I compensate for the lower volumes by pumping up the compressor gain on those patches. This evens out the levels and makes the rig a dream to gig with.

Don't know if the Yamaha has a similar capability but it might be worth a look.

My 2 cents!

MarkI have found FW on PC to sucketh most theriously. Doesn't Mac use a patented 6 pin protocol and PC use 4 pin or something like that?

Again, I've \_never\_ had a problem. I do know a bit more about computers than  
average, so maybe that's it, or maybe I'm lucky. It just hacks me off when  
someone says such and such isn't 'pro' when I get it to work just fine.

ers. They did not come with the cards. Also,  
I've been testing some screen drags with big windows today. I'm getting 100%  
CPU spikes on the PCI card when dragging a full sized mixer window at 1200 x  
1600 resolution (dammit!!! ;o( . This is sorta disappointing, but hey,  
overall performance otherwiae, as in general stability of the driver, is

much, much improved. I'll be blaying around with my color settings and performance settings to see if I can mitigate this some. I've conditioned myself to be careful about screen dragging during tracking anyway, but in a perfect world.....maybe something like a Colorgraphics Predator Pro AGP? Not a lot of VRam on one of those and I'm not sure about the drivers either....especially for win 9x.

I'm thinking M-Audio drivers.

I have 2 FW / USB combo cards from Compuseless. These things never worked  
right in PCs or Macs. They would drop out, or installing them in my PCs  
and my PCs would go in to black screen restart mo

>>"We simply can hear things, at times, that we cannot yet measure."

I'm sorry, but I disagree. In both your examples, had you recorded the signal(s) via pretty much any modern A/D converter and analyzed it off-line using readily available software (like Matlab), you'd have seen the difference as well as have heard it. The technology was there to detect those differences, but you didn't have it handy...that doesn't mean it wasn't measureable though.

One thing I agree with Ethan about is that its the first 30dB or so that really matters. Stuff that makes differences down around -80 dBFS or so is really low on my priority list. I'd rather put more money into having a better room.

Cheers,

KrisI picked up two DVI/VGA adapt

Every friggin one seems to have the onboard FW sharing IRQ with.....you  
guessed it....the AGP. I'magine if I were to get serious about using FW, I'd

buy myself one of those \*recommended\* TI based cards, pop it in a PCI slot that's not sharing IRQ and likely be good to go. I wonder if it would be possible to get something like 3 x RME fireface units working this way. Can these be daisy chained? Without wretched excess, I will die.  
;o)
