br />

Hell, it will not leave. Therefore, no souls are leaving. As for how many souls are entering Hell, let's look at the different religions that exist in the world today.

Most of these religions state that if you are not a member of their religion, you will go to Hell. Since there is more than one of these religions and since people do not belong to more than one religion, we can project that most all souls go to Hell. With birth and death rates as they are, we can expect the number of souls in Hell to increase exponentially. Now, we look at the rate of change of the volume in Hell because Boyle's Law states that in order for the temperature and pressure in Hell to stay the same, the volume of Hell has to expand proportionately as souls are added.

This gives two possibilities:

1. If Hell is expanding at a slower rate than the rate at which souls enter Hell, then the temperature and pressure in Hell will increase until all Hell breaks loose.
2. If Hell is expanding at a rate faster than the increase of souls in Hell, then the temperature and pressure will drop until Hell freezes over.

So which is it?

If we accept the postulate given to me by Teresa during my Freshman year that, "It will be a cold day in Hell before I sleep with you," and take into account the fact that I slept with her last night, then number two must be true, and thus I am sure that Hell is exothermic and has already frozen over. The corollary of this theory is that since Hell has frozen over, it follows that it is not accepting any more souls and is therefore, extinct.....leaving only Heaven, thereby proving the existence of a divine being which explains why, last night, Teresa kept shouting "Oh my God."Cool, I'll let you know how it goes. I don't mind buying it 3 times if I can get it! hehe  
Thanks for the tips.  
John

Chainer page 1 (Paris audio track 31,32  
(two cards system) senderella 3&4 on page 2.... sendrella 7&8 on page 4.  
Every page has another 8 vst slots so you can put a vst eq to eq your aux  
returns (different on every page so on every aux return !) you can put a  
stereo compressor ,or whatever you like it too.  
So your Paris rig can have as many aux returns as you want by only sacrificing  
(using )two Paris audio tracks.  
My preset uses 8 aux busses configured either mono or stereo (4 stereo).  
I believe thats enough !  
The only small drawback is that my default project takes around 2 minutes  
to load !!!  
I don't know why...  
Regards,  
DimitriosHey guys! I'm wondering would it be impossible to get modern DAW software  
to utilize the Paris hardware, including the MEC I/O cards? Is it possible?  
Is there enough information available about the hardware to do it?

Question for DeeJ: Do you have a schematic of the AES/EBU box you had made?

Thanks

JamesWhere is the zip file?

>Hello all,

I have installed NI Battery and have been playing with it  
in Cubase SX3.

I am getting clicks and clipping on the main bus.

I clicks when it triggers a sample.

It doesn't always clip the main bus, but it clicks all the time.

A limiter or volume adjustment fixes the clipping, but I can not figure out  
how to get rid of the clicks.

Please advise.

Thanks,

BrandonWhat version of Battery?

If it's not the latest version, get the latest. Early versions had all  
sorts of problems. The latest isn't perfect but is much more usable.

Second, adjust the buffer size in your sequencer. Maybe you need a  
higher buffer?

Third, try with or without DFD (Direct From Disk) in options.

Off the top of my head...hope that helps.

Cheers,

-Jamie

insufficient RAM when running VSTi's can definitely cause wierd

shit to happen to the samples.

I have 2gigs of ram with an AMD2+gig processor.

That should be enough right?

Where do I adjust the Buffer size?

Thanks,  
b

>It was version 1, wasn't it? And yeah, 2 gigs of RAM should be  
plenty... I was running it on 1 Gig - try either the buffer

settings in Cubase (the recording settings in your device setup menu), or in the driver for whatever interface youre using.
