Do you have any application that will give you a firm signal or
indicator if it's being clocked & locked? Like CubaseSX, an RME
card w/driver? Pulsar?

Maybe Paris won't but plenty of others do - what about any of
the freebies like Ardour or ??? Do any of those have a timecode
or wordclock lock-confirmation "light" or any such thing? If
so, maybe download one & see if it's indeed working.

It sounds to me as if it may not be, from what you describe.

NeilForgot to mention....

1.) when you ran the 3 cables out of the word clock outs; were
they all the same length?

2.) are all the cables 75-ohm?

3.) does ANY of the stuff you're trying to clock require
workclock termination, and if so, were you not running it
terminated?

If the answer to any of the above is "no", then there's your
likely problem, or at least the first place to throw in a fix.

Hey remember this commercial?

<http://www.youtube.com/watch?v=qsln8p8c8y0&mode=related&search>

That's a pretty big claim!

Since LaMont is right, maybe you guys should file a suit against Apple, IBM and Jeff GoldBlum;) Apple has so many frivolous law suits against them right now, maybe they would settle quick, or maybe their attorneys would squash you like a bug. And of course, I'm just kidding with you.

Power is no longer an issue or debate, thank god! Now it's all a matter of OS, applications, diversity, capabilities, and your needs. Good luck with your system purchase.

J
