osts about how he was doing this and then
talking to Dave, Mic Cross, Gene and Dimitrios about how they were
integrating Paris with other systems, I sort got this concept in my head
about how I wanted mine to work. It involved everything I've got here and
getting it working the way it is now. I really appreciate everyone's
feedback on what I'm hoping is perhaps the final piece of the digital
clocking puzzle.

When I went to bed last night, things were operating normally here. I just
cold booted the entire system and everything is still working normally. I
thinking that I may be actually nearing the limits of this old system as far
as adding dev

the master/slave thang, but you're right -- couldn't hurt.

Would be nice to solve one of these things every now and then without spending more money -- but I'm already leaning toward upgrading that card to the newer "DSP" version, with onboard midi i/o. And I have an older machine that my original 9652 would do well in. Then there's new samplers to look at, etc., etc.,

Daniel,

You are dragging them into the lower bin before quitting right?

This adds them to your user presets for other projects.

Tom

-----=_NextPart_000_000A_01C5AA9B.9F3DAFC0--I'm formatting a 120gb HD in Win 98SE.

What the heck is the relationship,
if any, between FAT32 and z:64? If a drive is formatted with the z:64 "switch"
on, can I copy files to it that have been previously saved on an HD formatted
with FAT32? I've searched the net high and low before asking here. All
my previous Paris audio drives have been formatted (with drive overlays -no
more of that....) with FAT32.

Thanks,

MRHow do you do that?

Formatting with Z:64 simply changes how the drive stores the information on the hdd. It makes the (I think) cluster size as big as possible, so when you're retrieving large files like audio files, it takes as few clusters as possible, meaning less traffic and mucking about by your OS to get the information on and off the drive.

As I understand it, if you format an 80 gig hdd and also format a 60 gig hdd, they will have different Z settings by default, hence there are no file compatibility issues between the different settings. It just controls the size of each data chunk on the drive, but a file read on or to the drive will come off again exactly as it was.

Cheers,
Kim.

e out
0# in aux1 first slot effect.
Then you engage the aux1 on the channels you wanna further process like kick
snare hihat and overheads.
Then you go to an empty track and put on eds effect slot wire in #0 , there
you will have a mix of all your engaged drumtracks.
Note that having AUX1 same level for all tracks you can have the same rough
balancing of levels as you have on your individual tracks.
Then you put a EDS compressor.a reverb (mono version) whatever.
There is some samples delay on that but anyway...
Regards,

```

> I am also a big Kevin fan, but he still looks like a 45 year old guy playing
a 20 year old guy. I am sure there are some of you that have tried or still use the following
method.
How to group stereo drumtracks in Paris put them a stereo compressor just
using two instances of EDS compressor.

1. I put on aux1 eds compressor with the following settings:
Gentle Crash algorithm with 1:75 setting -81.4 threshold and 17.5 db output.

2. I do the same on aux2 putting another instance of same compressor.
3. I open aux1 and aux 2 on all drumtracks, here I have one kick, two snares (top/bottom) two overheads (L and R) one ride and three toms
..
4. Now I put all auxes on pre post and I put all faders down to zero.
5. I put all drumtracks in the stereo field i.e Overheads L I open only aux1 and close aux2, the opposite for overhead R, the volume now is on auxe's knob.
For kick I have both aux1 and aux 2 engaged with same volume for both etc....
- 6 I can leave the return of the drumtracks on auxe's returns but I use instead wire out #0 for aux 1 and wire out #1 for aux 2
7. Then I go to two free audio tracks and put there wire in #0 and #1 accordingly.
8. I pan them hardwired left and right. I can take it further with eq or whatever from there....

So I have a compressed drummix stereo with EDS compressor using two instances of EDS comp.

9. You can write down the compressed stereo track and bring it in along with unprocessed drumtracks ,slide it until it sounds right nad voila.

I really like the eds compressor on gentle crush setting , I also favour the Opto.

Cheers,

Dimitrios Assuming from my previous post about stereo compressing we can take it one step further.

1. Use 6 auxes.
2. All auxes must be prefader.
3. All faders must be down.
4. Aux1 is the left front aux2 is the middle aux 3 is the right front, aux 4 is the back left ,aux 5 is the back right and aux 6 is the sub.
5. If you have more than one card you buy those new micromixers from Behringer 22 Euros each ! that mix 4 channels (mono) into one.
So all Aux 1 of say four cards go thru Paris hardware in one of these mixers and the output to your amplifier or your active monitor.
6. Now moving each auxe's volume you pan your sound wherever you please.
7. Note that you have to put on every auxe's second slot "external" to patch the aux to a hardware output of Paris.

I would like your input and additional thoughts on that.

Regards,

Dimitrios Absolutely, and a valid criticism. But, like Judy Garland in The Wizard of Oz (who was clearly too old to be Dorothy) *no one* else could have done it.

And, he gets to mug around with Kate Bosworth...

I don't see a downside here...

DC

Dimitrios,

I wonder if your stereo compressor is 'really' stereo in the way it triggers. I'd worry for instance that the left=20 could trigger because of a tom strike but the right would not.

Wouldn't it be easier to run a stereo EDS comp in aux 1, send your drum mix to it how you like using aux sends and=20 route the output of aux 1 via external to two channels by patching aux 1 to spdif in and out and then to two channels? =20 Print them to disk and compensate for latency that there? 1ms does it for me at that point assuming no look ahead. =20

Don't forget the spdif cable connected looping from in to out=20 on the Mec.

Seems like the easiest way using EDS effects. Of course you can also throw in any other VST effects once the tracks have been printed. As long as your sure of the drum mix you can do this as your last step. Kinda backwards but we use Paris don't we? Gyro Gearloose

and close aux2, the opposite for overhead R, the volume now is on = auxe's knob.

For kick I have both aux1 and aux 2 engaged with same volume for both etc....

6 I can leave the return of the drumtracks on auxe's returns but I use instead wire out #0 for aux 1 and wire out #1 for aux 2

7. Then I go to two free audio tracks and put there wire in #0 and #1 accordingly.

8. I pan them hardwired left and right. I can take it further with eq = or whatever from there....

So I have a compressed drummix stereo with EDS compressor using two instances of EDS comp.

9. You can write down the compressed stereo track and bring it in = along with unprocessed drumtracks ,slide it until it sounds right nad voila.

I really like the eds compressor on gentle crush setting , I also = favour the Opto.

Cheers,
Dimitrios

a whole new world of space for my main box. I'm searching all my existing
drives... resorting data on to new drives... haven't gotten to the bit
where I delete what I don't need yet.

By the sound of it I don't have nearly as much data as you have on your systems.
It's still a daunting task though. 4.7Gig just isn't big enough.

Cheers,
Kim.

Nope, it's not and that's how I ended up here. You don't even get the full 4.7 because of data overhead. How do I back up full AVI 720 x 480 2 hour raw footage in semi to uncompressed formats to DVD's? That's been a real drag. The Paris DVD with full renders, chapters, graphics and 3 camera angles running at all times got unbelievably large. Huge, in fact. Basically, I had to buy a second drive while doing it just because I had to impliment some kind of back up and simply ran out of storage. I need to run it back to 2 tapes for backup but that doesn't cover the need for the authoring to be backed up and also there is the formats problem. I don't think Hi8 will be exactly standard in 10 years. Ah, the dilemnas :)
