appreciably different from many solutions that have been around for years.
The MOTU 424 PCI card can handle 96 channels at 96K/24 and other manufactures
have offered similar solutions for the Mac.

Macintosh is its price/quality ratio; the DSP processing on board is only
for low latency routing. Hopefully it will sound great. It is at a price
point much lower then my Mytek 8X96 plus 2408/424 solution.
geneWord so far is it could be great, but let it sit for 6 months or so in case
the drivers aren't there, but that's just speculation, and it is based on
core audio, so it may rock big time for Mac/Logic u

Apple and Digi will keep working together, it's just another product, of
course any thing can happen.

Here's a hypothetical scenario. Digi dumps Apple, Apple gets dead serious.
Apple gets the best software engineers they can buy, and gets Logic really
rockin. Apple buys Apogee, JL Cooper, Creamware and UA! (I know I just
made some of you queasy. Sorry! LOL) They start building tightly integrated
DAW systems and AV systems with Logic/SoundTrack/FCP, and they release it
for Mac and PC! If the systems were affordable, do you think that Apple
would start to eat digi's lunch?

Seriously, your speculation could be accurate. Although, Digi won't be left for dead. They are proving that they can hang with the so-called low-end with their recent update for LE 7 Mpowered. Now you can record up to 48 tracks mono or 48 tracks stereo.!! Plus, they threw in all of HD toyz like: Full beat detective, translator..high-end Rtas plugins..(FOr a 500-\$1,000 bucks) upgrade ..

But, Gene is correct in that the new apogee cards are just low latency mixers. What do I gain? I guess, if I'm using Logic, I gain a better mixer???

The jury is stillout for me on this one. As stated by Gene, Motu is already doing this kind of thing, and they are doing it well..
Take care

>Oh Boy.. Have a look.. <http://www.sonicstate.com/news/shownews.cfm?newsid=2647>

This looks and sound great!!!I'm demo'ing one of the new Anthony DeMaria/Presonus ADL 600 preamps here. I

used it on a vocal session tonight. This thing reminds me of my first time behind the wheel of a 1968 Camaro Z28/302 V8. The thing is sooooo fast and torquey.....absolutely massive amounts of gain available. It was sort of a glued to the seat (or the clip LED) experience to get this thing under control for the initial level check. I couldn't believe how sensitive and powerful this pre was. Once I rethought my gain staging, it was very smooth, big and open. I can see how this could take ribbon mics into whole new realm. It wouldn't even breathe hard with a 77DX, I'm sure. It ws very easy to stand 10 feet away from the mic in the room with the mic settings at 12:00 and have an extremely hot signal when speaking at normal levels. A closer look revealed that 12:00 settings, though only half the available gain, are really sending some signal out of this thing. The only ribbon I have here is a NADY RSM2 at the moment. Not the most stellar example of a ribbon mic, but great on fiddles and guitar cabs (my primary use for it) I'll be giving it a spin soon. Tonight I mic'ed a femme vocalist with the SE Gemini through this preamp.

<http://www.heathersullivan.com/>

She's used to working in the big studios on the big toys in LA and NYC. She was completely floored by the Gemini (I didn't tell her how much it cost ;o). I had to be really careful with it on this preamp due to the sensitivity and low level detail of the mic and the incredibly fast rise time of the ADL 600, but the result was wonderful. This is a big, heavy tube preamp with 600V rails and vents all over it and cooling fins on the back panel. This preamp seemed to increase the audible frequency range of the mic. There were comparisons made tonight by folks at the session who have some pretty extensive experience with the AKG C12 and the ELAM 251. I've got very little experience with these old mics so I wouldn't know. What I do know is that depending on how the preamp was gainstaged and the impedance was set, the timbre of the signal through the mic could change pretty noticably and I didn't dial in anything that sounded bad to my ears.

..

I can't wait to try this preamp on some other mics. I've got a fairly decent rack of high end pre's here and I thought I was set for life as far as preamps go. Now I'm not so sure.

recorded through it yet. Any chance you can post something?
This should be a monster with bass on the instrument input.

gene

Hey LaMont! I don't think it would be a good idea for Apple or Digi to pick a fight with each other, that's why I don't think they actually will. You never know though.

I'm going to get a little deep on you here with my opinion on the subject of new gear. You might find what I have to say a bit funny being that I have sold you gear as a Pro audio dealer in the past;)

I wouldn't concern yourself too much, more and better is always coming. I say use what you've got now and make money with it. There is just too much stuff out there, and manufactures are always going to sell you the next wiz-bang shiny box, it's never ending. Your ideal DAW that's in your head will probably never exist, and if it did, the manufacture would want an arm, ah leg and a left nut for it.

Get what works for you and let the rest of the world and their hype go-by!

Remember it all ends up 16bit 44.1 or MP3s! Now we're going to 32, 48, or 64bit files!!!??? I know the arguments, but is it really necessary? I'm saying, striving for perfection is Ok as long as it makes sense. You've got to weigh out things like cost and necessity. Some audio gear has gone up in price and some has gone down in price, but one thing is for sure, what an audio engineer can make in this town has definitely gone down.

Think about it, the manufacturers tell you when it's time to upgrade, and they will always change the channel on us. We end up like a dog chasing it's tail. Good quality tools are important, but gear is not always the answer. Your chops as an engineer, producer, musician are more important. If the gear is getting in the way of creativity, flow, and production, then you need new gear. Remember, it's all psychological, it's about ego, we all want to be James Bond.

Sit back and wait, Music Messa will be Steinberg time, and others. There is also AES and NAB this spring, so hang on, it's going to get interesting this year. You already know everything I've been saying, I just thought I would remind you;)

Anyways, Hy-James was the high end Audio dealer at one time here in Detroit. The owner was Henry Root. His main business was selling tape, but companies like Producers tape were hurting him along with mail order catalogs. He could se

Il only so many Studer machines in this town at that time. So he got out of the business. He ended up working at Rocktron for a while, he was in charge of the X project digital mixer. Too bad for them, that the Yamaha 02r hit the market before the X-Project did. That mixer was ahead of it's time in ways with joy stix and surround sound mixing. It had CircleSound, Rocktrons dolby encoder, decoder, around 1994-95. Last time I saw Henry was a NAMM show about five years ago.

Tony Chris & Gene,

Tony, my client is using your technique from now on in DP.

Thanks for the heads up there. Wavelab was able to batch process all the files into 16 bit PAFs. That was good except some were stereo (I told him mono) which Paris didn't recognize. I ended up running those through Stripwav and those worked fine too. I wonder if I even needed to use Wavelab for this? It took a little longer than Stripwav.

All in all everything is rosy again over here thanks to you guys.

I hope I can pay you all back some day.

Tom

"Tony Benson" <tony@standinghampton.com> wrote in message = news:43d7c922@linux...

Before exporting my DP files I use the "freeze" function. It works = basically=20

like the render function in PARIS, except it actually renders all VST=20 inserts also. That way, all my DP files start at zero and are = contiguous=20

from beginning to end. No timing problems that way. Make sure your = friend=20

has auto latency compensation turned on in DP also. After the files = are=20

"frozen", he can select them in the soundbites browser and select = "export=20

as", etc.,etc. When you bring the files into PARIS, make sure you use = the=20

time lock tool or pull all the files to the very beginning of the time = line.=20

Should work fine.

Tony

"Tom Bruhl" <arpeggio@comcast.net> wrote in message = news:43d71045@linux...

Tony,

Your technique worked great combined with Gene's Wavelab batch processing idea. We are still sussing out the Toast issues to know just why it created such a problem.

Now we are having timing issues. My client suggests that he thinks merging files in DP is the only way to get timing correct. Does that

sound right?

Tom

Tom,

Have your friend try to burn a disc directly from the finder. On =
Panther,

all he needs to do is insert a recordable cd into the internal =
drive. The=20

cd

will come up on his desktop. Drag the files to the cd icon (it might =
take=20

a

while for the files to copy over to the disc image). When done, =
double=20

click

the cd icon and click "Burn" on the upper right of the cd window. =
Maybe

Toast is doing something screwy? I quit using it because of some =
troubles,

but that was a few years ago.

Will the files from the disc he burned import back into DP? I mean =
are the

burned files valid on his Mac? If so, and you can't get this fixed, =
mail=20

me

the disc and I'll see if I can batch convert them for you. Let me =
know if=20

I

can help.

Tony

news:43d59b80\$1@linux...

After every disk (we've burned over ten now) none of them
sounded audio or showed an overview.

I'm still trying everything in my power but I think the
clients software is what's holding us back. He's
using Panther/newest DP and newest Toast programs
on a G4 laptop.

Can someone sus out my Wavelab problem? I have an

original 3.01 disk with a 3.03 patch disk too. Neither will allow it to start up in XP. Is this version just too old? When starting Wavelab it gets into the program then stops instantly with: "This application has failed to start because HypGui.dll was not found. Reinstalling the application may fix this problem." Needless to say it didn't.

What is the solution?

I haven't been frustrated in a long time. This is taking the cake.
TIA,
Tom

y client is using your technique =
from now on=20
in DP.</DIV>
<DIV>Thanks for the heads up there. =
Wavelab was=20
able to</DIV>
<DIV>batch process all the files into 16 bit =
PAFs. =20
That was</DIV>
<DIV>good except some were stereo (I told =
him mono)=20
which Paris didn't</DIV>
<DIV>recognize. I ended up running =
those through=20
Stripwav</DIV>
<DIV>and those worked fine too. I =
wonder if I even=20
needed to</DIV>
<DIV>use Wavelab for this? It took a =
little longer=20
than Stripwav.</DIV>
<DIV> </DIV>

<DIV>All in all everything is rosy again =
 <FONT=20
 face=3DArial size=3D2>over here thanks to you guys.</DIV>
 <DIV>I hope I can pay you all back some=20
 day.</DIV>

 href=3D"news:43d7c922@linux">news:43d7c922@linux...</DIV>Before =
 exporting my=20
 DP files I use the "freeze" function. It works basically
like the =
 render=20
 function in PARIS, except it actually renders all VST
inserts =
 also. That=20
 way, all my DP files start at zero and are contiguous
from =
 beginning to=20
 end. No timing problems that way. Make sure your friend
has auto =
 latency=20
 compensation turned on in DP also. After the files are
"frozen", =
 he can=20
 select them in the soundbites browser and select "export
as", =
 etc.,etc.=20
 When you bring the files into PARIS, make sure you use the
time =
 lock tool=20
 or pull all the files to the very beginning of the time line. =

Should work=20
 fine.

-----=_NextPart_000_00F2_01C62228.83CD1690--Paul,

I've been waiting for Drumagog BFD. Does the midi function in Durmagog Pro
allow the triggering of BFD samples?
