Anyone here actually had any real hands on with this board/controller, especially with Cubase 4? James got me intrigued but I have read that the build quolity may be somewhat on cheesy side.

Thanks,
JonHey Jon,
Thank you for your kind words.
I feel happy when you feel happy too !
I had some emails with Peter the author.
he will be sending me a beta (just for me :) to try it in couple of days
to see if compensator works just fine !
It will have a dynamic allocation so the user can allocate whatever the highest possible latency will be neede !
Best regards,
Dimitrios

-----=_NextPart_000_002D_01C62110.C06CB1A0--Does SP2 cover everything that SP1 & 1a
covered or do I need to install SP1
before SP2? It would sorta suck if this is the case since SP1 isn't
available for DL anymore (though I have it on a data disk here)

Thanks,

Deejit's clearly on Apple's radar along with the rest of the MOAB stuff
since they've already released one security update that directly
addresses MOAB.

Meanwhile, exclaiming over a MOAB potential exploit doesn't help
Microsoft's already virus encrusted world become any better. It will be
interesting to see what Vista brings to the table.

Cheers,
-Jamie

There ya go. Make the waveform "On" and "Off". Think Rush's 'Vapor
Trails'. God, would I love to whack that mastering engineer upside
the head, and then give the tracks to a REAL mastering engineer.

I don't think it's too low by a whole lot, but I would like to hear it
in a more dominant position vs. the music. Don't slam the fader up,
just massage it a little.

At some point, I'd like to hear some more from her.

pabl've got 31 tracks playing back on a Cubase 4 project with the 2 x HDSP
9652's, a Multiface and 4 x UAD-1 cards on the Gigabyte GA-K8NS Ultra 939
mobo.AMD 64 4800 dual core CPU. I'm running the latest RME beta 17 drivers
at 32k buffers (0.7ms latency) with 23 UAD-1 plugins pushing the UAD-1
resource meter to 92% and the Cubase VST meter is running at around 75-80%.
No crackling or dropouts and I've been inserting these plugins on the
fly.....no crashes. This far exceeds anything that Cubase SX was able to
accomplish with the last RME Alpha driver. I would have been at 1024k
buffers at least and I really doubt I would be able to play back anything
without crackles and pops with the Cubase VST meter at over 60%.

Pretty impressive. I'll be testing out the control room function sooner or
later. We're getting into Paris territory for tracking at these latencies.

;o)

>Hi Jon,

I haven't left Paris. I'm just experimenting with stuff trying to mix natively and getting something I like as much as a Paris mix. Mixing on two platforms is sorta driving me nuts and I've been totally spoiled by the feature set. Once I've accomplished that, then maybe I'll mix completely natively. I'm experimenting with a Neve 5042 tape emulator on the Cubase mix bus tonight. I'm also experimenting with some new RME drivers that seem incredibly stable at low latency. I've been pretty happy with the Pulsar cards I've been using as well but what has appealed to me about them is their stability when interfacing with Paris during mixes. I Don't use the synths and plugins that they offer very much and I'm just not convinced that the Pulsar system will make the jump to 64 bit. I think that's going to be an important jump to make in the future and I want to be ready for it. I'm actually trying to simplify by making things temporarily more complicated and doing a lot of experimentation right now. If I go back to the RME cards for my native platform, I'll likely keep at least one of the Pulsar cards for a farm system and I'll probably keep Paris around for a tracking platform no matter what. I just haven't seen anything yet that functions as smoothly for tracking and for quick punch ins/outs as a Paris system. I'll be giving the plugins that Dimitrios has been talking about a good run on Paris, but I'm so spoiled by the Cubase editor that I sorta doubt I'll be wanting to go back to something else. We'll see though.
;o)

>You REALLY have to try C4 with a dig/analog console set-up
for direct monitoring... channel for channel. Punch-ins and
transport functions are so snappy, you will forget about
tracking to Paris... seriously. I can punch in and out of a
track in N3, rapid fire succession, while trimming
previously recorded segments on the *same track*. It is so
fast and seamless it's scary... you really should check it
out. The DM2K we use here has a remote layer that works
flawlessly with Nuendo/Cubase. We get transport control,
full perimeter control/automation and complete recall/reset
capability that is saved with the session. Combine that with
24 high grade mic pres and up to 96 channels of digital I/O
and routing.... well I think you get the idea... ;-)

David.

Hi computer people. I have a Toshiba laptop that has been hard crashing as if the C drive connection is bad. I just replaced it last week. I don't think it's the drive. Sometimes it helps to remove power and the battery to enable the drive to reappear even in the BIOS. I have a huge weekend of gigs revolving around this computer.

Using Acronis I have a hidden directory on the suspect C drive with a complete recovery. I also have a complete clone on a USB drive.

What do you think I should do? I have to have it running tomorrow by 12:00 in the afternoon! Gigs in 3 states.

Thanks for any help!

Tom

Thanks Chris,

I'm running PCDJ.

It's older with the 17" screen. It has a fairly standard drive I think.

It's a Toshiba. I know that. I just bought the new drive so

I'm thinking strongly that it's the mobo.

I am trying to get it to boot from USB. Can I do that?

Chris,

Satellite P4 2.4 USB 2 I think? Originally it had a 40GIG C. I cloned from Acronis to a 60GIG and it worked perfectly for 2 days. Now it's shutting down or not booting. Acronis says there's no drive. I remove all power reset and then the drive will show up but Acronis isn't running! It's one or the other but not both. I'm thinking the best bet would be the USB drive that has a working C copy. Can I boot from that on a laptop? I think I had that working way back when I made the clone.

Chris,
How can I change the drive letter to C without completely
screwing up another computer in Disk Management?
This one won't let me go below E. I'm guessing all=20
others will be the same.
T.

Chris,
Satellite P4 2.4 USB 2 I think? Originally it had a 40GIG C.
I cloned from Acronis to a 60GIG and it worked perfectly for
2 days. Now it's shutting down or not booting. Acronis
says there's no drive. I remove all power reset and then
the drive will show up but Acronis isn't running! It's one or
the other but not both. I'm thinking the best bet would be the
USB drive that has a working C copy. Can I boot from that
on a laptop? I think I had that working way back when I
made the clone.
Tom

Thanks Chris,
I'm running PCDJ.
It's older with the 17" screen. It has a fairly standard drive I =
think.
It's a Toshiba. I know that. I just bought the new drive so
I'm thinking strongly that it's the mobo.

I am trying to get it to boot from USB. Can I do that?

Yes it does sound like either motherboard or power supply to me.
If the chipsets between the Acer and yours are close enough then he will
probably be able to pull off the restore.

Good Luck..

Chris Ludwig

ADK Pro Audio
(859) 635-5762
www.adkproaudio.com

chrisl@adkproaudio.com I really like the new RME drivers. Very stable so far and with the new

Cubase4 Control Room functions, the issues I hated about Totalmix might be a thing of the past. The RME driver is very easy to use and fast to change buffers. Changing buffers in Scope is time consuming and requires a reboot/reload of Windows to be effective. However, the Scope driver is easily as stable as the RME driver and, I think, will probably still operate more efficiently at 1.5 ms latency than the new RME driver according to my preliminary tests. There are also some very cool tools/features to the Scope environment that the totalmix doesn't offer, such as phase alignment in the mixer. I'm trying to make some final decisions as to which native audio platform (RME or CW) to use. Since I don't really use the onboard FX of Scope, the quickness of the RME control panel appeals to me, but the incredible flexibility of the Scope routing window is also appealing. I absolutely hate the Scope midi implementation. I can't seem to get it to work as a midi input/output router for midi controlled external hardware. The RME midi works flawlessly for this. Also, ASIO and mixer channels are limited in the Scope environment and the bigger the project you need to create, the fewer resources you have available because you can't offload any of these functions to your CPU. Once you're out of DSP resources, you're hosed. Both platforms have their advantages/disadvantages. If I can get the RME latency compensation to work on external FX (something I'm having some issues with on Cubase 4 right now) I may just keep one Pulsar card for a farm system and go with the RME cards for the native DAW. the Scope midisuckage and limited DSP (unless you buy the \$1400.00 "pro" cards) make it a bit less appealing to me in some areas since the projects I configure are so large and require so many resources. The CW stability at low latencies and it's Parisfriendliness when synced to Paris ADAT are big plusses. I haven't yet tried syncing the new RME drivers to Paris ADAT. That will happen probably next week. the RME system was so unreliable with my configuration last year that this is the reason I switched to the CW system. However, I have changed and simplified the configuration since then so the RME system may well be happy this time.

Regards,

Deej

>I've been eyeing that Tascam 48 channel behemoth but not really too hard. I
can't afford the Yammy you're using. I think I can prolly get something
joyful happening routing tracks/busses in the Cubase 4 CR to my Furman HDS
16 cue system, use it just like I use Paris and then use my Houston
controller for the mixer functions. I don't need preamps and I scored a
used/perfect condition/fully loaded Friend-Chip Audio RMX32 yesterday for a
song. It's configured almost exactly as I would have ordered it if purchased

new. Between the Cubase 4 VST routing window and the RMX 32, some of my kludges are going to go away and I will need less to accomplish more (famous last words...eh?)

BTW, I'm expecting the glossy horse to show up any day now. I'll let you know when.

;o)

>>My understanding is that Freeze does not allow further automation so instead just render to a new track committing the effects, you can always go back (see my section in my treepad on "rendering with effects"). A trick the fine Morgan mentioned to me was to render a track out fully wet and have two tracks side by side Dry and Wet, then mix/automate to taste.

When you render with effects with File / Mixdown / Selected tracks you can check add to pool and project window and the render will bring you a new track back in. With this technique you can still add automation as you ride faders/pans/eqs etc. Then disable the effects on the old track or remove it entirely, or drag your new tracks events up to the old one and replace it with the new committed events and delete the newly added track.

CTRL drag will lock it as you drag up and down.

Copy Events by Select Events. Drag. Press Ctrl-Alt before releasing.

Also the multi track export scripts allow you to get a beverage and export many tracks in a batch. Get them here for now:
[www.kfocus.com/Multi Export of Individual Tracks.zip](http://www.kfocus.com/Multi%20Export%20of%20Individual%20Tracks.zip)

Kick out the jams !

Congratulations.

I wont be buying any 99-cent-per-song singles since I have the antediluvian
version (Which I love.)

to the CD Baby link below. "In stock now, will ship within 24 hours" as
it says. BTW it's an excellent CD.

"Sarahtonin has bee

x 1" tape machine for mastering!

I did this exact thing for 4 years while using Paris for music / audio
post at the TV station. I had no problems with audio data in either
direction.

Dude,

You wanna split that up into a couple of paragraphs to I can read it without my head exploding?

pabl like this idea.....

>"They can adjust the transistor for high performance or low power," said
>David Lammers, director of WeSRCH.com, a Web portal for technical
>professionals.<

1000W PSU's may start getting popular in the DAW world. this is exciting stuff.

;o)

Just a thought,

CLWow! 1 terabyte, FW800, RAID, and 400.00

Impressive. Let us know how that works out for you.

>Hi Don,

Nice that you bought faderworks. This shows to the author that we encourage these kind of moves regarding Paris oriented plugins.

Regarding Pulsar it depends on why you would want Pulsar ?

If you would need it for further processing ala UAD1 then that is a smart move.

Please describe me your Paris rig and I will let you know what I suggest.

Regards,

Dimitrios

ase as my primary mixer what all would need to be

>purchased.

>

>

>Don

>

>

>

>Hi Dimitrios

right now I have

2 MECs - both have ADAT modules and one has an 8 in and 8 out

second rig has a dakota card lightpiped and ADAT sync's to Paris...it's loaded with a number of special ed DAW's and plugs as I haven't decided on which DAW to use although I am leaning towards Cubase or Nuendo

I use mainly Wave plugins but I can see a UAD card or two in my future real soon

I do mostly mixing but would like to be able to record a max of four tracks at a time...anymore and I just use a studio or my partner's rig.

Keeping Paris might be an option but with what I'm reading re: the Neve 2 buss comp I could just as easily dump it.

>Don,

Before you make the jump away from Paris by virtue of reading my posts about the Neve, I would suggest that you try one. It isn't **exactly** the same as the Paris bus. It's something that I like personally, and I like it enough to make the jump to something else. One thing that I like about it is that it is **simple**. You strap it across the stereo bus, dial it in and you're done. No mass of cabling and redundancy like an outboard mixer or external summing device. It is very expensive for what it does though.

When I posted about how much I liked the Pulsar cards, lots of folks jumped and I think that was a good jump. I would recommend this system to anyone. The Pulsar can work on it's own with a native system at very low latencies and also is very stable when interfacing with Paris. It is, in itseldf a very sophisticated mixer and routing system and I like the DSP (and if I was a **snythhead** I'd be in heaven* so if you need these things it's a no-brainer. Since I won't be interfacing Pulsar with Paris anymore, I will be selling my 3 x Pulsar cards and the Magma that houses them. If you're interested, shoot me an e-mail. It will make you a monster rig if that's the direction you're headed..

The Neve, OTOH, is basically a very expensive one trick pony. I **definitely** wouldn't bail on Paris based on **my** opinion about it. My advice would be to demo it for at least a week and make a very serious effort to see if you can get what you're looking for with this on large track count mixes before you decide to buy it or to sell your Paris gear.

Regards,

Deej

It's this:

<http://www.rme-audio.com/english/premline/hdspaes32.htm>

and this:

<http://www.rme-audio.com/english/premline/madibridge.htm>

.....so far.....

I think I can make do with my Muliface and CW A16u converters interfacing with this. The Multiface can be used as a standalone interfacing via ADAt if it is set to disconnect. At least that's what I have heard. If not, I'll sell it too and get another standalone AD/DA.

Deej

;o)Oops..sorry.here's the MADl card:

<http://www.rme-audio.com/english/premline/hdspmadi.htm>

AES/EBU will allow to pass or be state modified with the correct circuits.

Layman's? Yeah, it works just keep the cables short as possible.

now and have decided
it's ready for prime time. For those of you running an audio box where you
would like to be able to do some general tasks, writing emails, documents,
web surfing, etc., it's a great way to manage things. Your audio install
can be completely static while your 'alternate' VM can be whatever you want.
For me, it's Debian so I can write code and such, but if you wanted you could
even install some awful version of Windows.

Very cool, and I'm posting this from my new audio laptop running a Debian
VM,

TCB Don't worry...this is a better place to learn about Cubase than the Cubase
forum

>HI DJ,

Just so you know with the current beta driver your using you can use any of the HDSP cards in conjunction with the MADi card. Cheap way to add AES I/O.

Also to answer your question on the RME the Optical MADi output is always active and duplicates the outputs and visa versa. These are MADi optical not ADAT I/O in case your thought that.

Oh and the new series of AD/DA converters from RME will have the option to use MADi as well as ADAT and AES connection in groups of 8. When using the MADi option on the converters you just daisy chain them till

you fill the cards I/O. So up to 8 converters @ 48k and 4 @ 96k. They are supposedly adding 192k support for the card sometime soon. I believe it will be just a firm ware update.

Here are to 2 upcoming MADI AD/DA.

(859) 635-5762 Thanks Chris,

I've been crunching the I/O port numbers here. I was coming up short on I/O with the MADi so I am reconsidering the MADi . When I think in terms of these systems, I think of the number of I/O ports since I interface a lot of digital gear. My current HDSP rig (2 x 9652's and a Multiface PI) totals 7 x optical I/O ports and 3 stereo coax ports, all usable separately.

The MADi rig with the ADAT bridge would then give me 8 optical ports (either ADAT or spdif optical.....right?) on the MADi bridge plus another spdif optical port on the card for a total of nine that I could interface with outboard devices and use simultaneously.....correct, or no?

Now, if I added my Multiface to this setup, I would be compromising the single PCI card scenario (which appeals to me) for another ADAT port, plus another stereo coax port. This would give me a total of 10 - equal to what I would have with the 3 xHDSP cards I currently use (or 11 if the one on the plate of the MADi card can be used simultaneously), but a net gain of yet another open port because I wouldn't be sacrificing an ADAT port on the MADi bridge for an external A/D converter.

I was wanting to be using as few PCI cards as possible with my setup and three HDSP's along with 4 x Magmas seems like I'm pushing the ragged edge as far as PCI bandwidth goes, but right now, with the GA-K7N8s mobo, it's working. I'm wondering right now, since my performance is good, what the real advantage would be to going MADi if I have to have the Multiface to achieve the I/O ports I need.

Given that a system is running properly with eith

er card, does the MADi

system achieve better performance/latency than an HDSP card if used solo?

If so, do you think that adding a Muliface to the MADi system for the extra

I/O would degrade the performance of the MAD I. I'm looking down the road at trying to get 64 bit compatible and I know it's going to take at least 1 x 64 bit Magma for my RME cards (unless something else comes along) so the fewer PCI cards I have to configure, the better.

Thanks,

Deej

> www.adkproaudio.com <http://www.adkproaudio.com/>
> (859) 635-5762OK, not an exclusively "Paris" type question, but not entirely OT
either: I'm mixing some tracks here that were recorded to ProTools by
another guy in a nice Neve room in LA. Tracks are nice and fat...
Trio jazz piano/vocal type stuff... But this piano: tracks are all
set up "Mid - Side"...

So -- I'm an all in the box guy here on my humble Paris system. My
approach for this is to copy the "side" track to another channel, flip
phase, pan the two copies left and right, group those faders and push
them up to taste in combination with the "mid" channel, which is doing
most of the work and is panned -- doh -- center... However, the
session engineer -- an old-school English guy with about 300 times

more experience than I, says he has a better way to decode this. His way: send the "side" channel to an aux (post fader, pre pan), return it to another channel in the mixer (set on "input"), leave them both center panned, the first channel at "0" (nominal gain), then flip phase and push up the return's fader until it nulls -- which it won't, actually... (here I say "huh?" and he says "Yeah, it's a ProTools thing") But anyway, push it up until it "thins out" as far as it's going to... Then, leave that fader right there forever, pan the channels left and right, and control levels for both "sides" with the one fader (of the channel which is sending...). Which works actually very well -- and *does* sound different and better than the "copy channels and flip phase" method... But, in a word -- Why...?!

By the way, in order to do this his way on my rig, I'm sending to an external output -- adat lightpipe looped back to itself -- which is then patched to another mixer channel which is set to active input... Probably introducing some itty-bitty latency here which is why the channels don't null... I'm also going to test this (for kicks) with analog in and out -- but I doubt things will get any better, as there would also be a couple more conversions taking place, and who needs that? One other potential issue: these are 24 bit files at 44.1 -- and I'm wondering if my lightpipe patch for the aux is truncating the signal to 20 bits? (I know this has been discussed in the past, but I'm just dumping all the questions in here now in case anybody wants to actually clarify *everything* for me in one go...)

Thanks, I realize this is rather long-ish... And I'd almost put a smiley-bob here -- if I actually ever did that sort of thing.

-- chas (thinking about buying all of DJ's stuff, bailing it up, and sending it into earth orbit as the first truly vintage digital audio satellite array)Chris,

I didn't mean a MADI Bridge. I'm talking about the ADI 648 MADI>ADAT converter.

Also, I can get around the port limitations with an ADI4 DD. I am planning on adding 2 x ADI 8DD interfaces anyway to up/downsample my outboard gear for use at higher sample rates so with my POD Pro, Mytek Stereo AD/DA converters and DAC-1 (all of which operate at up to 96k) on my AD4-DD and my outboard gear on a pair of ADI8-DD's, I will have more than enough additional optical ports to handle everything else and can operate all audio I/O routing through a single PCI card. It's more flexible than using the 3 x HDSP cards and when the price of 2 x 64 bit Magma's (one for the HDSP cards, the other for the RME cards) vs one (for just the RME cards), or even the possibility of needing none (if a new FW, etc. model comes out) or if I can configure all of my UAD-1 cards and the MADI PCI in the 5 PCI slots of my mobo without IRQ wars, the numbers start looking a lot more attractive.

I will post two pictures dictating the appearnace of the friend's studio that has the over midrange problem with whatever they record and all things sound midrangey through the Genelec monitors.

Note that he uses Neumann M149 thru the hybrid Millenia Media (tube and solid state) that are considered as world class machines.

He uses a RME Fire800 card and Nuendo.

I would appreciatte and wall treatment propositions to tam this mid frequencies
