r but only

a top 50% Live user and I'm trying to change that.

The great scandal is that they all sound freaking great, arguments about summing bus minutae to one side.

Good luck,

TCB

Paris aux sends, patching the output card to

the FX sends/returns in stereo pairs in the Paris patchbay.

I don't know if it will make any difference in initializing the modules to have them on opposite sides of the MEC (mine are next to each other in slots 1 & 2 and they work just dandy.

Deej

de, were the machine keeps
restarting on start up. So it could be the FW card.

Speaking of high quality mass-produced computer hardware, every time I add

memory to my PC, the system goes haywire, with distorted display, crashes, the restarting thing, or just fails to boot. I've tried different memory, it's definitely the high quality after market MOBO.

James

Here in Greece there is no such option from any store !
I see most wordclock generators are 6 output wise !
What do you do if you need say 8 or nine ?

Regards,
Dimitrios

You don't "have" to do stems... I just said that you can hear a difference if you do. You can also hear a difference if you use one brand of convertors as opposed to another, or run your mix through a Dangerous 2-buss, or take several submixes out of your analog outs of the Multiface & sum them through an external mixer, or if you were to stuff your ears full of cotton... it may be a difference you like, or a difference you find so miniscule as to not matter.

NeilA Lucid GenX6 gives you 6 WC outputs. Adding a Lucid CLK-6 gives you another 6 WC outputs, but you lose one GenX6 output to connect to the CLK-6 so you end up with 11 clock outputs total. I'm not really convinced that using clock regenerators is the best of solutions, but it may work for you.

As far as Mytek gear goes, I was also using the WC output of a Mytek Stereo 96 A/D converter for my house clock until it went south on me. I can no longer get reliable sync from this unit (it still clocks reliably to the Lucid GenX-6) and I've also got a Mytek Stereo 96 DAC that has quit functioning properly. The s/pdif inputs no longer work, though the optical input still works. I'm getting ready to ship them *both* back to Mytek.....Mytek gear sounds great, but I'm not really impressed with its reliability at this point.

Rosendahl makes a clock module that has 12 outputs.

>Just buy one of everything, each with a separate dedicated computer and
identical converters and build a separate, identical control room for each
DAW, oriented in a big circle and get you one of those Herman Miller chair
that is the industry standard for mix rooms and office hockey and then open
the doors to each control room. Hire someone to push said chair, sync all the
DAWs to a common clock and timeline synchronizer. Hit play on the

synchronizer and they will all start playing the same project at once. Then have your chair pushed from room to room to each sweet spot while you sit in a lotus position contemplating the mix bus of each DAW.

Get back to us with your findings.

;o)

There are a lot of ways to skin a cat. This might be one of them, the new Tascam DM-4800, with Logic, DP, Cubase, or Nuendo, etc... You could also hook up an analog tape deck, they are cheap these days.

The Tascam DM-4800 is available now! With the optional FireWire card you get 32x32 I/O channels to your computer with one cable. You could get a FW Extendit box and have the computer 300 ft. away if you wanted. A high quality 20' FW cable should work though.

This is your DAW controller, analog and digital audio interface, effects processor, audio router, talk back facility, transport controller, etc...

If that's not enough inputs for you, with two DM-4800s and a single cable you get 128 inputs. There is also the X-48, but I think a computer is a better idea.

>I e-mailed the folks at Brainspawm this morning describing my setup and
telling them what I was hoping to do with Forte vis-a-vis Paris. They are
interested to see how this goes and they provided me a developers license so
I can try to get this happening.

Now that I've got a full version that saves presets and won't time out, the
first thing I'm going to do is to try to create preset FX rack for Paris
using UAD-1 plugins with the Delaycomp + an additional sample delay (which
is possible with this plugin) to compensate for the buffer settings of the
native audio interface. I'm going to work my way up to a 40 channel scenario
with 8 stereo aux busses to/from Paris. The Delaycomp will be set to
compensate for 4 or 5 UAD-1 plugins (this may change depending on how much
latency is created and how this translates to the Paris editor timeline
usability-wise). I'll be doing some latency measurements to see if it's
going to be something that can work reasonably well when working with Paris
automation while mixing. If the latency is low enough to allow usable visual
reference in the Paris editor during automation tasks, then we've got
something we can use, so as I mentioned before, the number of plugins
possible will be more or less dependent on the *feel* of all of this. The
routing capabilities of this program are mind boggling and may provide us
the elusive bussing options that we currently lack in Paris. If this looks
like it's going to be successful, I'll make up a few templates and get them
to Kim so Parisites can DL them for use with the Forte product. I can even
envision this working with a native audio interface running on the same

machine as Paris (thus precluding the need for two DAWs), as long as it had the horsepower. If it works the way I'm hoping, this would allow you to open up a template that is preset to compensate for "X" number of plugins on each track that is routed from the I/O of a DAW running UAD-1 plugins and Forte to the I/O of Paris. I think I may be able to get multiple external hardware processors working across Paris submixes...like I'm doing with Cubase right now. It appears that Forte has some synchronization options as well. I'm not far enough into it to even know if plugin parameters can be automated, but if so, and it is slaved to the Paris timeline, then that's another biggie. Will it be stable?well, anything would be more stable than what is happening when trying to work this way with Cubase SX so it's worth a try. Will it sound good? Not sure. there will definitely be more gainstaging issues than what is happening in SX, but hey.....we're supposed to be engineers and it's our job to kick some gainstage ass!!!!.....right?

Putting on the lab coat (which has straps to modify it as a straightjacket)

utomation usable with up to 5 UAD-1 plugins on a track. This was the first experiment.....to see if it's possible to load lots of UAD-1 plugins on a track and still be able to use Paris fader automation relative to the timeline of the editor as the timeline scrolls during playback. If this didn't work I was going to bail immediately since my whole point of this is to achieve something that is actually practical using Paris automation.

Now I'm going to get brutal with Forte/my native DAW and streaming from different submixes and see if I have any of the freezeups that I was having with Cubase SX.

(rubbing palms of hands together with evil glee!!!).....MUHAHAHA!!!!.....c'mon Igor.....let's get a pair of pliers and a blowtorch and get midevil on it's ass.....

;o)

Doctor DeeJ, your going to make me switch my Paris rig to PC,..... aren't
you?

Funny I think I said somewhat the same thing many posts ago

heehehehehehe

DOn

ps. DJ - way to go on the Forte app...looking forward to your resultsYes. I've got 12 drum tracks cranking through various combinations of UAD-1 plugins. They're absolutely slammin' with no drift/slop at all and the editor is scrolling right along with the audible hits on the events with 5 plugins compensated on all 12 tracks. The CPU meter on the DAW running Forte is idling between 2% and 3% while processing these 12 tracks.

I'm having a problem with the menu's in forte right now. I've got 72 I/O on my native rig. They show up in stereo pairs and then below as mono I/O. When I go to choose an output for a new bus, I can't go beyond 12 before the menu runs out at the bottom of my screen. I've got a post in to the developer about this right now. Also, I'm seeing something that leads me to believe that it may only be possible to create 15 busses in this app. I'm not sure about this yet but that's gonna limit a few things as I need to be able to create a bus for *every* Paris track in order for this to work the way I need it to so I'm gonna need 36 mono busses and 10 stereo busses.

.....back to the lab.....I'm getting ready to torture my UAD-1 cards.....muhahahaha!!!!!!

>Hi,

The 2x Multiface/PCI or this combo works well and is affordable.
2x Presonus FS AD/DA converters 1x RME HDSP 9652.
Both come out to about the same price.

You can mix and match up to 3 HDSP series card to this such as the
Multiface, Digiface, 9632 and soon the AES32 and MADI cards and any ASIO
based program such as Samplitude will seem then all as one driver.

refer what I'm
doing for a reason. I guess you'd best do something else.

ne of the main reasons for this (I'm almost certain) is because of the sample delay between EDS cards. Signals that are routed between the digital I/O of the RME cards from ADAT modules on MECs attached to Cards B/C/D are almost certainly receiving this sample latency. It's a wonder this even works at all. Add to it the fact that the RME cards are all receiving their clock signal from MEC ADAT modules and the modules are on cards A & B, it's almost certain that the RME card that is attached to the MEC on Card B is receiving a clock signal that is not sample accurate with the signal that the other two RME cards are receiving from the ADAT modules on card A. Now, let's throw into this whole equation the fact that I've got three outboard modules patched into the three S/Pdif I/O of the RME cards and these devices are receiving their clock signals from the RME cards which are clocked to the Paris ADAT sync and the signals that are routed/being processed through them are routed through auxes on MECs attached to Card C and D (now there's the sample delay between signals routed through these processors and the 4 x
