>Dimitros,

I remember something similar a couple of times and fixed it with starting from scratch with a new project with the same files. It was a painful affair. For me it looked to be too much different information in the saved file, after saving the song some hundred times. I have also had luck with changing the problematic files over to other channels when I had saving problems.

Erling

moves settle in, but let me put a couple of things in perspective...

For all you non-Melnbournites... which is the vast majority of you, I used
to live in Glen Waverley. Glen Waverley is, according to my "Melways" directory,
about 20km from the city centre of Melbourne Australia. Honestly I thought
it was further than that before I went for the actual number from the book.

Suffice to say I was a fair way out...

As I I

hang an MBox or an 001 off of it and advertize that I have Pro Tools here
;o}

```

My current native audio system is running an AMD XP3000 CPU on a 333MHZ system bus with 2 x gigs of RAM. Considering the fact that it will be at least twice (if not more) s fast as her G4 466 Mac, this will be more than enough for her current needs with Photoshop, Illustrator, Pagemaker, etc.

Since I keep my computers set up on open SenFu test benches in a machine room, what I'm going to do is buy a good, quiet case, PSU, video card, audio card, CD/DVD player/burner, floppy and a big storage drive for her, install the current system drive, mobo and aforementioned componentry into that, reformat the drive, reload Win XP (so that she's not running the *tweaked to hell* system I'm running now) and buy her the Adobe software that she needs to be productive.

Next, I'm going to build another native system. I'm going to need a mobo, RAM and a dual core AMD CPU. I'll be interfacing my audio hardware/UAD-1 cards using a Magma 13 slot chassis so I'm not really concerned about the number of PCI slots. One thing I do want to be able to do is to use my two existing Matrox G450's (AGP and PCI) Due to this, I am leaning toward trying the ASUS A8V-Deluxe mobo just because I'm familiar with the quirks of ASUS, I know that one of the PCI slots will be hardwired to the AGP and I know that since the Matrox cards share the same driver, this **should** work nicely with the host card of the Magma using az PCI slot that (hopefully) isn't sharing an IRQ with any other device, or at least benignly with something friendly. I'm also going to be going with at least 2 gig of DDR in this machine.....maybe more. Guess I'll check ASUS' site to see what's recommended.

Lastly is the CPU. I want to be able to operate this machine as much as possible at low latencies with VSTi's. I've been eyeing the dual core 3800 CPU's because they are the least expensive right now, but skimping will defeat the whole purpose of this upgrade.

Is anyone using an AMD dual core CPU system right now? If so, I'd be mighty interested to hear your experiences before I once again descend into computer building hell.

Thanks,

DeejOk i got a new cpu and reinstalled paris... I need a new challange key! who can i contact?"DJ" <animix_spam-this-ahole_@animas.net> wrote:
>Wife definitely wants to abandon Mac and switch to Windows.

hey, DJ- Howdy!!

this has nothing to do with your question (of course!)--

just a thought. I don't know how much I've told you about this - my memory is harder to upgrade than these computers' -- but here's my personal plan.

Macs for internet = no viruses, no adware, no nuthin' (at least as far as I can tell, and compared to the XP machines on the internet that I know of.)

XP machine for heavy duty work stuff -(with considerable overlap - I transfer stuff between machines manually with a traveldrive all the time) but never let the XP machine onto the internet. Never. XP machine I put together last year is still running flawlessly.

The iMac I'm using right now came, like most of my computers, used - G3, piles of ram, OS9 and OSX, newer versions of most of the programs I use -

for \$220 last January. I think it's crashed twice in 12 months. Does the iTunes thing. I spend most of my time on this toy -- plus I can even toss it in the car and drag it to places like the world's heaviest laptop.

I tell everyone who's just getting into the internet to grab an old iMac and go.

Ok, steve out....!Thanks, I will. Well, all was not lost as I had thought. I started a new project using the same name and my recorded tracks appeared, only the project was lost. 8:)

The machine I just built for Nuendo is an A8V Deluxe with an Athlon 64 X2 4800 and 2 gigs of Kingston RAM. I'm liking it so far, but I haven't taxed it yet, so I'm not sure where the break point is. I did a simple test recording 24 tracks at 44.1/24, played those back and recorded 24 more, played all that back and punched in and out repeatedly on the last 24. The CPU indicator in Nuendo didn't get past ONE light.

Then I added a bunch of native and UA plus to the tracks (at least 30 plugs, most of them different). I played back the 48 tracks and punched in and out of 24 tracks with the plugs running. The CPU indicator never got past 4 bars. Oh, and I'm only running XP home (not 64), and standard IDE drives! :-)

David.

#4 isn't shared. I'm also thinking of going with a Matrox P750 since I'm
just using 3 x monitors on my native system. I can use the G450 AGP on my
wife's computer.

Newegg has very good deals on the components right now. I can get an A8V
deluxe with 2G of Corsair RAM and an AMD 64 4400 x 2 for around \$800.00.

That oughta get me what I need here and then some.

Thanks,

Deej

> Ok, steve out....!For everyone that doesn't want a Mac, it's great that you don't have to
have one. I wasn't completely sold on Macs in the 80s when the Atari
offered better MIDI features at a lower price and the Amiga offered a
more exciting computing vision, although the Mac of that time still had
some advantages in available software.

Fast forward to the 90s. OS7-8-9 were careening off the tracks - stuck
in decisions and mistakes of the 80's. No preemptive multitasking, no
clean protected memory design, band-aid on top of band-aid to wire
around obsolete legacy code. And after years of unsuccessfully

attempting to rewrite their way out of the bag, scrapping the whole mess and starting over with OSX was the salvation of the company.

You could argue that the GUI and some operating specs should have changed less. I would agree in some ways and disagree in others. For example, requiring a ".xxx" extension in the name for file identification was a step backwards. But for the most part the changes were for the better. For example, core audio is great.

The transition wasn't cheap. But it did capitalize on the experience of NeXT and the engineering talent they acquired with the buyout. Reportedly it was either that or buy BeOS, the other major option on the table. Both were good choices with advantages and disadvantages.

At this point the dual G5 boxes out now have plenty of muscle and available software for audio production, with the ability to do amazing amounts of real time tracks, virtual instruments and effects.

Speaking of desktop hardware speed, at times Motorola has been faster, at times, Intel, at times AMD and at times IBM. Motorola's slower-than-expected rollout of improved G4 chips and then IBM's slower-than-expected rollout of G5 upgrades the last few years have put Apple trailing more often than not on the muscle car front, but to say "extremely slow" is inaccurate. At the moment, the quad G5 has a pretty good claim for leader of the desktop pack and the duals are no slouches.

Offering Intel chips will put OSX head to head with MSWindows and it will be interesting to see that comparison.

Price wise, Apple has been a bit more expensive, about the same or a bit less than comparable offerings from similar turnkey computer companies depending on the product range or how you compare. The downward trend on prices overall has not exempted Apple, Mac prices have come down over the last few years (despite their unfortunate decision to pull the plug on Mac clone manufacturers).

For those who want to build their own boxes, especially in configurations Apple has not offered, that can be a money saving option. I say "can be" and not "will be" money saving because some box builders I know end up turning over their hardware fairly often. And their old hardware typically holds a lower resale value than Apple hardware. So whether building your own boxes is cheaper in the long run is not always a sure thing.

Factor in the time spend researching, building, testing, replacing components, fussing with drivers, customizing your MSWindows setup. Then, depending on what your time is worth, the comparison may come out differently. But there's no denying that building your own box may give

you a closer approximation of what you want, assuming Apple doesn't already offer what you want and assuming you don't want OSX and you really like MSWindows, BSD or Linux.

Speaking of BSD and Linux, if up front cost is the measure, by far the cheapest-upfront-cost way to go is to build your own box and run an open source OS and software. For example: ubuntulinux.org/download/ The back end costs are similar for any box building adventure, time spent getting it all to work and getting software happening.

Cheers,
-Jamie

>>Hi DJ,
>>Deej,

I'm using the ASUS A8V-Deluxe with a 7 % overclocked dual core 3800 CPU(49 degrees Celsius), but not for Paris use. I'm using ATI 3700 graphiccard with it and E-MU 1820M audiosystem. No problems at all with the little use I have had with audio works on it.

For the Paris system, I'm now using an Epox 9NDA3+ motherboard with a 3200+ processor. It couldn't use my Matrox G550 card with it, so I bought a G-Force FX5200 card, to be sure it would work with the nForce3 Ultra chipset on the motherboard. I'm using an Artic-Cooling Freezer 64 Pro on the processor and a North-Q 400w power supply with a 140 mm super silent fan. I must say I was asstonished when I saw the temperature was stable at about 42 degrees Celsius on both processor and motherboard when driving the system hard. Between the two Paris card it showes about 10-12 degrees higher, so the new system is about 10-15 degrees cooler than my old Asus A/V600-X board with a 3000+ processor. On the old system I had for the most problems wit Paris and WinXP, but on the new system, I havn't had any problems at all on both WinME or WinXP after using it a couple of weeks. So I'm crossing my fingers that WinXP now will work as WinME allways have done for me. So, it seems to be a wonderful system if you're not using Matrox graphic cards with it, so Doug, here you're out.

I have tested both boards with recoding videoes with Nero 7 and the dual core system was unbelievable more speedy.

 >It sounds like I should read up on core audio. Too bad our beloved PARIS
 won't be able to take advantage of it. Windows XP completely sucks for MIDI
 timing as soon as a few DX plugins are thrown into the mix. I haven't tested
 this since getting a dual Athlon setup, so maybe it will do better with extra
 CPUs. Most of my software doesn't, though. Who knows.

I'm using fewer and fewer plugins all the time. I caught myself wishing
 I could run PARIS in windows 3.1 earlier. :) Maybe I should try it in an
 old mac running os 9.

Take care,

Mike

old, saved information at all
 from scratch. It's important that all files are rendered to
 from zero in the old
 project.
 If this doesn't help and the earlier rendered stereofiles have
 absolutely correct lengths, I can't think of other
 things than plugin problems. Hope this can help
 explain my way of doing something with this
 kind of problems.

 & Sory if I ask much but the way I do the
 project
 rebuild does not help. How do you do a
 rebuild
 ? I just go to audio folder export audio objects or
 wave
 files under a new folder then save
 the new song
 and then reopen from new folder. I guess you might
 refer to
 something different here right ? Can you explain
 your way
 ? Thanks
 Regards,
 Dimitrios

 wrote:
 & Dimitrios,
 I agree with Erlilo.
 Try
 different channels or a different submix if you
 can. Otherwise rebuilding the mix from
 scratch in
 a new project is the next best bet. Copy all
 mixer
 settings and presets of effects to make it easier.

>DJ,

What I would suggest is pick a used Creamware card that uses 32 bit integer
(not floating) bussing has 64 mixing busses as ASIO so you can use your Nuendo
and mix on Pulsar great digital consoles that rely on dsp and not on cpu.

Great clearance.

I bought one for 400\$, now I have three Pulsars.

One of these days I will describe you my system , Paris, three Pulsars and
cubase.

Regards,

Dimitrios

I'm doing a story for EM about 64 bit processors/operating systems. As part of that I'm upgrading myself (also leaning toward a dual core Athlon because audio apps are fairly multi-threaded). The one suggestion I might make is checking out DFI boards. They've really become the benchmark gamer board

while also being rock solid and that's a rare combination. They do stuff like rev a board to put more layers between memory tracing to decrease crosstalk. Certainly worth a look.

Also, you might want to check out the Cakewalk forums/news. They're leading the charge on 64 bit Windows audio computing.

But seriously, a fully passive summing box can be DIY'ed for about \$20-\$150 (depending on the features and # of channels you need), and then you can use whatever flavor of mic pre for gain makeup. On a scale of 1-10 in difficulty, this job is a 1.5.

>> Hehe , well...

This is an academic question to stop wonder.

Also it is important if you have phase coherent tracks like more some of
your drumtracks have to be on second eds card while recording.

The real question is this latency between eds cards applies only on playback
or also when monitoring...:)

Well in any case I would like to know that.

I have a multi preamp system where some preamps go to analog ADAT in cards
and some digitally either via adat card or spdif or both.

So there are different latencies involved.

My DBX 376 and 386 have a 13 samples latency compared to analog mec card
in.

But I use spdif on 4th eds card.

So when I record the dbx both with Paris analog and Paris spdif I detect
this 13 samples latency for the spdified track.

I know also that 4th card gives me a 17 samples latency.

So to clear things out I would like to know the following :

If you record same time on both first card and fourth card analog only, will
the tracks playing back with 17 samples latency or this is only when you
move tracks from one card to the other.

Regards,
Dimitrios

First things first. Applications are run as one or more threads. An appliction can be coded to run as one massive thread or as more than one smaller thread. Some applications lend themselves to running as multiple threads very well (an audio app, for example, which can quite efficiently have threads for every plug-in, every EQ, the mix engine, graphics, etc.) and some do not (an SSH file transfer, for example, or a database query). Each thread has to be assigned to a processor, and can't run on more than one. So, if you have a quad processor machine (any platform, any OS) and your machine is running three threads then one of the processors by definition will not be used. So it *is* necessary for software to be coded to use multiple processors, save that maybe the app can swamp one while the rest of OS is multi-threaded. So we all can learn more and do some more reading when it comes to computers.

As I've said here recently, to me OS X and M\$oft OS's are simply two sides of a nearly identical coin. Neither grants their users the right to change the platform for the better. Neither allows users to share their modifications and improvements with others. Neither compels other to offer similar freedoms. Until one or the other does (ha ha) I'm happy as a clam over here with Debian and Gnome. Acutally I think Gnome beats the daylights out of both OS X and XP as a desktop.

Oh, I build a PC that ran a goodsized database and serves out half a terabyte of data per day. It's never crashed and has had uptimes of over a year running XP Server. So don't tell me a PC won't run right if it's set up right.

>Hello Everyone,

Just wondering if there was anyone here that would be interested in building a computer for Paris. I have a 2.8 gig athlon with kt600 chipset Asus board, don't recall what the # is on the motherboard. I switched to xp about a year ago and have not really been able to get this computer working as it should. I am now getting busy in the studio and really need something that is reliable. Thanks, DavidThanks Jamie for knocking some sense into me and throwing yourself on this

"grenade". I almost made a huge mistake! I'm sending you the G5 now and have just ordered the parts for my DIY PC. I'm having them shipped to DeeJ though so he can assemble, tweak and test for me. I wouldn't know the Bios from the Biosphere, so. . . ;>)

Seriously, I used to get miffed at Mac bashing, but now the whole PC vs. Mac thing just seems silly. I'm typing this message on a PC, one of six or so I try to keep running and playing nice together on the network here at work. Over the years I've had at least ten different Macs. Right now my home network has two PC's (one my son and I built) two Mac desktops, and two laptops (one PC and one Mac). The fact is, all the computers I take care of are fantastic, and all of them suck. They're fantastic when they're working right and suck when they don't.

Peace on earth and good will toward men, yada, yada, yada.

SX/nuendo?

the apogee site says to terminate with a T and a terminator at the input,
when the device recieving WC has only In and Out.

Does this method work with Paris??

lights look good.

Paris LOOKS happy too. Both Mecs set to "Word". Optical lock lights are on
for all adat modules.

everything looks good on 9652 also... green word clock light is on and
everything reads correctly on the settings panel... everything is synced...
clock mode is set to word clock and sync ref says Word.

problem... i don't get any audio from 9652 adat 9-24. 9-24 is connecting to

Mec #2(submix 2) modules. when i put a file in submix 2 i hear it... but in live mode i hear nothing from nuendo. everything is fine on adat 1-8 connected to Mec 1 (submix 1).

i am at 44.1

any suggestions?

Jeremy

>thanks Aaron!

wasn't there some kinda "procedure" for clocking paris to an external source.

like....

your default project had to be internal 48k.

and then you switch to word at 48k...

then change the external source to 44k?

i dont remember the procedure but i thought there was one!?

>Phil Schiller explains in an interview in 2001, near the end of the article.

<http://news.com.com/2100-1040-254554.html>

Mac OSX uses symmetric multiprocessing. Here is information from 2002.
Look for the line that says, "Mac OS X features symmetric multiprocessing,
enabling the operating system itself, as well as applications, to take full
advantage of dual processors for dramatic performance gains."

<http://www.apple.com/pr/library/2002/jan/28pmg4.html>

Here's an article all the way back in 2000 talking about symmetric multiprocessing on a Mac.

<http://www.macosserver.com/editorial/2000/08/02.1.shtml>
