>>Hi DJ,

I have no doubt at all that your SPL 9629 blows the DB De-esser away!!!

I guess my point was taking yours a step further even.

I think that even ok, cheap-beacuase-it's-old hardware blows the doors off plugins, and given that such gear is so cheap, it might be a better a solution than plugins.

We use the DB de-esser at work doing voice overs for TV, and it helps, but we're still not happy with it. We're working with a very tight budget, so adding hardware isn't an option - we don't even have the outputs and inputs to interface with external devices, so it's a non-starter.

I can appreciate not having the hardware option.

But, if you've got it, I think it's worth looking at.

All the best,

Mike

There are a couple of factory refurbs on ebay right now, starting at \$20.00.

Here it is! <http://www.digitalfishphones.com/main.php?item=2&subItem=5>. Thanks, Bill.Undestood Mikie. I wasn't trying to be argumentative (honest ;o). the DBX is actually a very good unit and for \$60.00, I can sure see your point. I've been happy with the DB De-esser, but I've never really thought of it as being in the same league with hardware.

Regards,

Deej

>I have used an Epox 9NDA3+ with a 3.2 processor some months now with Paris

and it's the only board I've had that's been working in XP with Paris for more than a week without chrashes. I have had a couple of blue screens in this periode but it seems to be stable over long times, so for first time, I'm not afraid of working with Paris in XP. It's working as normal in ME too with Paris for me, so it's the best Paris board I have owned.

If I record 16 channels elsewhere with the portable system, I'd like to bring it back to the main and sync, so I could be able to continue with the project(s) on the 16 channels on the main, with the 16 channels on the portable.

I guess perhaps this isn't too realistic, but I thought it was possible. I was also hoping to do this without purchasing more equipment, besides sync cables.

Oh well, I'll scratch it this if I have to purchase more equipment to get them to sync... thanks again...

Don't bother trying to adjust settings within Cubase, as the buffer/latency
settings are locked
once Cubase nabs the soundcard driver.)
If you have a Dakota, (as have I), you'll find the buffer size settings in
the "System" tab in the Dakota control panel which you can access in the
Windows system tray. Try the highest setting first, and see if this cures
your problem.
Regards,
Kim

Right now I have two midi tracks...one soft synth and every 60 seconds or so
"pop" I can always render to audio but that too is a pain

I don't notice anything with audio tracks so I'm thinking this is a soft
synth resource thing
