choose "Disable" to disable error reporting.

Disable Power Management - Power management can be disabled by going to "Always On" and set "System Standby", "Turn off hard disks" and "Turn off monitor" to "Never".

Disable Screen Savers - Screen savers can cause unexpected performance glitches, so you'll want to disable them. Disable any screen savers by

Set graphic acceleration to full - You can do this by going to your desktop, right clicking and clicking on "Properties" then on "Settings", "Advanced" and the "Performance" tab. Make sure the Hardware Acceleration slider is s

yes most all video cards are native 32 bit. If you have on that doesn't work well with that setting then your video sucks.

> Visual Effects for best performance

Yes. Otherwise known as Classic Mode

> Processor Scheduling for Background Services

YES YES this is the only real tweak that makes the most difference.

> Uncheck Remote Assistance

I would but I use it allot. It has no impact unless you are using and its impact is minor.

> Increase your IRQ priority

No point. Worked well on 98 and on older motherboards but doesn't have any effect on current hardware.

> Turn off your visual effects

Your repeating yourself

> Disable Error Reporting

Make sure you leave the critical notification checked.

> Disable Power Management

As mentioned above yes

> Set graphic acceleration to full

Yes. You should never set it to anything else. When you do this you are tell the video card to let the CPU do all the work instead.

> Disable your system sounds

Of course

> Disable background applications

Depends on what you mean by that.

> Specify your own virtual memory settings, If you have 512MB RAM or
> higher set this to 384 for Min and Max on same drive as XP

No. That was good setting for 98 but not for XP. I usual

That would be great, they are very useful cross-platform apps.

That's why I mentioned "minus the overhead." Although I _have_ seen some tests where some apps did do surprisingly close to double the speed but I can't remember the specifics. Might've been BeOS. Alzheimer's is kicking in...

From what you posted before, we were talking about a test where the Intel running Linux (wasn't it?) beat a dual G5 (2GHZ only?) with the then-current version of OSX in a specific multi-threading situation. It didn't spank on every test, and where Altivec was used the G5 won out. If we're talking about the same test.

Of course there's lies, damn lies and benchmarks. For which you rightly criticize Jobs as a cherry-picker, as are many people when the time comes to market a system. Where benchmarks are most useful though is when a benchmark can closely represent a real-world situation, such as rendering tests with a 3D app, speed of oft-used image filters (although those are moving to real time performance with the GPU under OSX's core-image) or testing other actual apps under high loads (like your threading test apparently did).

, faster bussing speeds, faster memory, and two processors are faster than one. Apple went with the first processor available and used it in both models. It's not the fastest Intel chip that will be available to them.

The iMac is a consumer model, they haven't released the Mac Tower Pros yet!!! Although, when they do, I'll bet they won't be the fastest Intel based machines available. I guess we'll have to wait and see on that one.

It's no secret that the PowerBook was lagging way behind. I believe that is why they got the Mac Book pro out to their business customers first. Give it time, Intel will release faster chips and the Mac Book Pro will get faster. Right now it's Apples first offering.

Jobs does a great job as CEO, and he does know how to put a good spin on their products, he just did it yesterday! You should go find out for yourself, and find out what he really did say, instead of hearing a tidbit of information and jumping to a lot of wrong conclusions! I recommend watching the keynote speech, although the PC zealots wouldn't be able to stomach the truth.

Apple had to do what Apple had to do. IBM couldn't get a G5 mobile chip out that worked. On the desk top, IBM did not meet their time line for releasing faster G5 chips, and I don't think they could tell Apple when they would be able to. Apple always knew that this would be a possibility, that is part of why they have been running Mac OSX on Intel systems for the past five years now. The other reason I believe they were doing this is in the event MS dropped Office for the Mac they would be ready to roll out Intel based Macs and or Mac OSX for the PC. sort of a computer software cold war. Notice they signed a five year plus operating agreement on support and product development. Well that's my opinion.

As for the question on Apples past processor performance.

In the past the Apple PowerMac G4 with a single processor were tested against a standard Intel Pentium 4, by independent computer test labs, using industry standard test software. An Apple PowerMac G4 1.25 single processor model tested in the speed range of a Pentium 4 2.8 to 3.0 GHz. Later the G4 1.42 MHz's were tested against the original 1.6 to 2.0MHz G 5s. The G5s were about 70% faster than the G4. There has been all kinds of independent testing, If Apple was lying about performance they would have gotten sued. So I have my doubts about Celerons eating G 5s. Check out both links.

Here is some performance info on the G5 dual 2.7GHz.

<http://www.apple.com/powermac/performance/>

Here is info on the performance of the Apple G5 quad 2.5 GHz compared to the G5 dual 2.7. About 70% faster performance.

<http://www.apple.com/au/powermac/>

It's not logical to think that a Celeron could eat a G5. So when I hear a rumor that a 2.8GHz Celeron ate a G5, it makes me think it's PURE BULLSHIT!!! I asked Morgan to get the guy to post on the NG. Until then, it's hearsay. I'd like to know what scientific testing standards he used??? I'd like to know which model G5 was tested??? Where the machines similarly equipped???

Anything is possible, but I think it is just another PC zealot spreading more bogus rumors about Macs. I'll stick with lab testing and real world usefulness, not B.S. rumors.

Just because some guy says something is so, and ten thousand people repeat it, doesn't mean it's true. Even a bad rumor with one leg will find away to get around! Even though it has nothing to stand on!

I think people can see from the test above that something is not right about the rumors, but of course the PC zealots will argue that it is the other way around.

Some people just won't let the facts get in the way of their opinion.

Why is the idea of meaning lacking in musicians now? You're losing me here.

>

>>Me, I like modernity.

>

>But that is a period style too! Nothing new there. Even "shocking the bourgeoisie" is boring.

I meant not a particular style but the general state of the modern world, where I can listen to music from across the planet and drive to work and fly to Japan and so on. And as far as "shocking the bourgeoisie" I work 60 hour weeks for an organization that manages \$15 billion. To be more establishment I'd need to make partner at Goldman Sachs.

>The concept here is improving musicianship and the appreciation of music in our time. Try to stay on-topic...

No, the question was whether "nobody *cares* anymore" about music, and whether there was some previous era in which people did. I use the example of food because it's a great example of how modernity allows us to become *more* passionate and interested in things. Had I lived in the time you talk about my musical and culinary horizon would have been severely limited to what I could find within a few miles of myself. Instead, today I can enjoy the dub of Jamaica and the electronica of Berlin and the hip hop of Oakland all in the same day.
