I find this disturbing and further, I think it ties directly into why so new and challenging music is being made.

DCThanks Mark, I tried it. Looks like a nice program. it found some stuff that the others did not. Cool.

Still at 50% load. Sigh...

e Start Menu:

Right-click the Start button, and then click Properties.

Click Classic Start menu.

Click the Customize button to select items to display on the Start menu.

By default, selecting the Classic Start menu also adds the My Documents, My Computer, My Network Places, and Internet Explorer icons to your desktop.

Click on the Screen Saver tab, Set Screensaver to None, Press the Power button near the bottom

Hibernate..If this is Enabled uncheck it. This is mainly for Laptops but uses a very large chunk of data.(I've seen this not show up on the first boot of XP..when you restart it will be there but it's disabled)

Disable automatic update - Since Windows XP will connect to the internet to find updates automatically for you, you will want to disable this. Sometimes beneficial but unnecessary and often annoying, you can ditch

Disable system restore - Windows XP has a built in function to back up system files to help reduce the risk of crashes due to lost data, software conflicts and so on. The drawback, is that a fair bit of system

overhead is used to perform this and can be disabled if you choose by

Restore" and choosing "Turn off system restore on all drives."

Advanced tab: Press Settings tab under Performance Visual Affects tab:
set to Adjust for Best Performance.

Advanced tab: Processor Scheduling: Set this for Background Services

Increase your IRQ priority - You can increase the IRQ priority of the
real-time CMOS clock to gain some system performance by doing the following:

1.) First create a text file with the extension .reg

2.) Paste the following into the file:

REGEDIT4

[HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\PriorityControl]
"IRQ8Priority"=dword:00000001

3.) Double-click on the file to enter the tweak into your registry.

This can be un-installed should you need to by repeating the three steps
above with a new file, except this time use the following in your .reg file:

[

ly set it to

double or 3x the ram in the system but set the min/max to the same. If
I'm using more than 2 gigs then I just set it to equal the amount of ram.

> Disable auto-insert notification

No point unless your system is really slow.

> Disable USB

Doh not again

> Graphical window settings

What?

> Remove Taskbar popup balloon

Why? You won't be able to mouse over the icon to see what it is as easily.

> Speed up Menus

If you want but I think they fast enough.

> Disable offline files

It will save disk space thats about it.

Un-checking "use fast user switching will a more useful effect by not loading as much user info into ram if you have multiple account on the system.

> Disable Internet Synchronise Time

If you want but it won't have any effect on performance.

> Disable Hide Inactive Icons

Yes

> Disable Automatic Desktop Cleanup Wizard

Yes just because is annoying.

> Disable NTFS Last Access Time Logging (NTFS Only)

It helps a little but you probably won't be able to see a difference.

> Disable disc indexing

Yes

> Maker sure DMA mode is enabled on drives

Shouldn't be an issues at all on a current motherboard but might be on older motherboards running xp.

> Do Not Map through Soundcard

No

If this is a fresh install and you have run disk clean up then yes this
can make sense.
