lipping, and you'll be fine. If you need that "hot" sound, use a plugin (tube sim, etc.).

3.) Want more "glue"? Group things together & use a comp across the group, or simply across the main buss if that does it for you.

4.) Avoid the Cubase dynamics plugins like the plague. They truly suck, IME. There are plenty of other compressors out there, - both paid & free - that are much better. MUCH better. I like the buzzroom package, myself... those things RAWK. Also, the Cubase EQ's are fine for many things, but I prefer Matt Craig's Paris VST EQ for drums, FWIW. A good EQ that I like for keyboards, and that also has a bit of a saturation effect option is the Classic EQ from Kjaerhus (it's free), and this can also tie in with #3 & #2, above... strap that across a stereo group & whether or not you're using the EQ portion, if you enable the saturation you'll get some nice warmth going. Those of you with UAD cards or the like will no doubt already have your favorite toys for doing any of these things
