>HI Gantt,

Sorry for any vagueness.

I mean to say that the Older Firepod which was re-branded for what ever reason into the FP10 was more reliable over all. They designed that unit using an older BridgeCo Fire wire chip which didn't have any bells and whistle features of some FW chips but worked OK. It pretty much won't work reliably under 10ms with most any system but for live recording setups that is not a big deal. Thats more important for studio and VSTi people.

The Firestudio series are using TC electronics Dice 2 chip which is full of compatibility issues and performance issues. Some Devices from TC, Presonus , M-Audio, Mackie, Apogee plus other use this chip and almost all have some form of compatibility problem with Sonar and even with other apps that have a correct implementation of ASIO. Most of the issues involve compatibility issues with Fire wire chip sets though. Even TI ones.

The only fire wire interfaces I've seen be the least problematic are the ONLY manufacturers that use their own fire wire chip design. MOTU and RME.

The Turion64 is a slow processor but if all you need to do is record 2 to 8 tracks at 44.1k or 48k you should be fine.

Reaper will by far be the best choice for this on a slower machine.

There are something you will want to find out before you invest in ANY audio interface for this laptop.

What OS version  
How much ram.  
How big and what speed is th internal drive?  
What Fire wire chip set is the laptop using?

Being a AMD laptop it might be using a Via CPU chip and Fire wire chip set. Which actually might be a good thing.

For a laptop you really need to have either TI or Via based fire wire to improve the odds of it working.

Yes we had lots of lemons in the fire studio series.  
They seemed to have gotten whatever manufacture ring issues they had out  
of the way but still haven't gotten drivers sorted out to be a stable as  
they should be.

If Tascam didn't have the worst customer support period I would be recommending one to him. I didn't think their support could have gotten worse but now it is basically non-existent. Which is too bad because that was a great unit when it came out.

I'm pretty sure Sonar was designed from the bottom up to use Microsoft's WDM. Pretty dumb idea IMHO. WDM was a disaster waiting to happen. Never quite being finished. Having to be hacked by driver developers to even get it to work at anything close to ASIO. Even then MS was constantly changing "improving?" it with little or no interaction with the Pro Audio world. The only real improvement in WDM had to do with gaming and home theater use. Which Logically was more important than the tiny tiny Pro audio market.

Other than some sort of strange politics of the time I'm not sure why Cakewalk didn't develop Sonar around ASIO instead. Oh yeah they said that they didn't want to be at the mercy of a competitor. So it's better we go with a driver model that is completely unproven developed by a company that no interest in the Pro Audio market. Go Figure. I must say it is the most daring development design idea they ever had at least. :)
