>It doth rock much.

Unless it works before the compressor in the signal chain, it won't come close. Do you know if it does? I'd love to save the time.

DCSo far have used this on two tracks by the same male vocalist... one was a soft vocal track using my "Claytor-67" tube mic, and as I said in a previous post, I was thoroughly unimpressed & immediately went back to the Chandler TG2 for that application. Tonight I had a chance to try it on a harder-edged vocal track with a TLM-103, and it worked out pretty good for that. The previous mic pre we'd been using for this was the Focusrite ISA 428 on the ISA 110 impedance setting, and the Portico definitely imparted a slightly thicker or richer, and also a little bit smoother, quality to the track, but I wouldn't call it a "warm"-sounding pre, necessarily. I liked the "silk" setting - not sure what that circuit's all about, but it worked for this application, and imparted a little bi

>Dimitrios,

Hi these news of these new vintage plugins is really great, been waiting so long for some good eqs and more compression options (although Vinco is excellent).

I still run Paris but only as an effects box for my Creamware mixer.

JesseHi,
Pulsar's environment the "scope" as they call it is the one you WANNA use and not avoid.
Latency within pulsar is around 20 samples including adat in/out.
You can wire in and out whatever you can think off like adat ins /outs to from mixers ins/outs to effects ins outs to/from ASIO ins/outs whatever you can imagine and stay with 32 bit fixed not floating "fixed" meaning true 32bits as opposed to 32bit floating which is 24bits actually.
Just pristine audio no matter whatever routings you take or give...
You can ofcourse use Pulsar cards without the "scope"environment like RME cards but what is the point of doing that ?
Missing all that great routings and dsp effects ?

go to:

www.planetz.com/forums
And read your heart's out !!
You will be needing days and days of reading there...

Regards,
Dimitrios

rds won't lock to incoming spdif and
tthat needs to be addressed at some point, but I'm asking these inputs to
recognize other devices when daisy chained through two digital patchbays.
It's really a non issue because I'm not using them right now
anyway.....but I'll get around to it eventually.

I'm off to the hot springs now.....time to
chill.....errr.....relax.

;o)

>Hi Don,

The vst eq bit cancels with the paris eq when phase inverted.

I forced Brian T to try it when he was unconvinced.

I know that everyone is dubious, but matt worked 24 hours a day for months to ensure that he could perfectly emulate the paris eq.

I am familiar with the "pretty colored and non-linear" comment about this plug, as I read and responded to it way back when on whatever vst forum it was posted in.

I know this won't help anyones perception, but when I hear people wondering how to capture the paris special sauce - this plug is it.

Doesn't the PARIS ADAT only support 20 bits?Correct. Cany you tell???..... I can't hear any difference.

Don't have the gear to make a comparison, but I suspect that the difference between 16 & 20 bits is greater than the difference between 20 & 24...

>>I've received some e-mails recently asking if I know if the M-Audio
Digipatch units will pass 24 bit audio. I have read in numerous forums over
the years that they pass audio bit for bit.

M-Audio's tech support is impossible to contact today (I tried) but I found
the following info online:

The Litepipe protocol used by the Digipatch, known as DT-16, is a format
intended to support 16-bit Type I ADAT devices. Other Litepipe formats are
not guaranteed to work reliably. All coaxial S/PDIF and Optical S/PDIF
(TosLink) are fully supported.
<http://www.technosound.com.cy/easyconsole.cfm?id=526>

Now what does this mean?.....well, my optical and lightpipe
devices work fine with these units and none of them are DT-16, to my
knowledge so does this mean that since the Digipatch Units use DT-16, they
are truncating 20 and 24 bit signals to 16 bit or should it mean that they
shouldn't work at all? I don't really know. I do know that I have never had
a problem passing optical 20 and 24 bit S/Pdif or 8 channel lightpipe
through these units so if they aren't supposed to work at all, and since
even though they aren't guaranteed to work then since they **are** working,
perhaps they are passing bit-for bit.....or maybe they are truncating to
16 bit so it **will** pass signal, but this doesn't **seem** to be supported by
the statement above. Either it should work, or it shouldn't.....it
would seem.....and if it works, since the following statement
was made:

"All coaxial S/PDIF and Optical S/PDIF (TosLink) are fully supported."

.....then it should it be supporting bit-for-bit transfers?????
I guess the answer to this question is as clear as mud...right?

One thing that the Digipatch doesn't do is to reclock signals so if your
cable runs are extremely long, you may get jitter or worse.

;o)Chris Ludwig <chrisl@adkproaudio.com> wrote:

>street price is 699-US

Thanks Chris, I do believe you may be right. I'd initially looked at the ADI44-DD. But that was when I first started and still believed I should be able to find a straight ADAT --> Multi-S/PDIF conversion box. Of course, I later found that I instead needed to go ADAT --> Multi-AES --> S/PDIF, then never got back around to re-considering the RME. Go figure.

This is starting to creep further and further up into the \$\$\$, though (especially considering the routing solution alone is beginning to get as expensive as any of the single units I was looking at hooking up).

I'm starting to wonder if the cash might rather be better spent by just grabbing a used Digipatch, then dedicating the ADAT port for Dimitrios' Pulsar/SCOPE scheme instead. ;)

In any case, thanks again for the helpful recommendation, Chris!

>The CDL 313 boxes are 16 bit. I've got a couple of them here and they work
>very well,

Aha! So the CDL's **are** 16-bit after all. That's how Sweetwater lists them, but when I visited Hosa's site they mention that they're 24-bit. I'd hoped perhaps Hosa had upgraded them in a newer manufacturing run, but I'm afraid what they're actually saying is simply marketing speak for, "sure, we can handle 24-bit, and we'll even be happy to throw away those pesky 4-8 extra bits for you." Ah well...

>I do
>stuff like this all the time to entertain the people here so the idea really
>appeals to me, but believe me, Chris Ludwigs idea is really the way to go.

Yeah, I get caught up in little experiments like this too. Then I start searching around everywhere until I finally kludge together a solution. And by that time I've got so much effort invested in it that I just instinctively pull out my checkbook.

Then, if I'm lucky, I stop myself to ask, "okay, now I know I **can** do this; but the question is **should** I do this."

Erm, yeah. Maybe... (And that's on a good day when my wife's looking at me with a certain look that clues me in that my GAS is getting the better of me again).

---=_linux447cd859--Ok, here's what I have been doing.

-first- let me say that I owe Sakis everything for this, since what I am doing differs little from how he does it. Also, DJ got me thinking along these lines and I want to thank him as well for the great input.

Simply, it's 4-band multiband compression in Paris. DJ made the point that signal flow in Paris goes through the EDS compressor before the EQ. What this means is that if you split the bands with the PARIS EQ the EDS compressor is still responding to the full bandwidth signal because the compressors see the signal before the EQ.

If you do this, and open up the compressor windows, you will see the compressors working in perfect unison. It works fairly well nonetheless, but I wondered what would happen if you bounced the track with the comp off and the filter in (yes you have to do this 4 times for LO, LM HM, and HI bands) You then end up with bounced tracks that only have the desired bands on them.

Now, you turn off the EQ, and bring the 8 tracks back to the editor (use the time-locked tool please!) and put them in their correct channels. As Sakis said, use low comp. ratios and do not make big changes in threshold from one band to another. I ended up using various thresholds and about 1.55:1 ratios with little or no makeup gain. You want to see about 3-6db gain reduction depending on the material.

Group all the faders together. Run the sub master and global masters cranked and now you can use the PARIS mix buss as a fat control as you desire when bouncing back to 2 tracks.

This is **very** tedious and you have to be relentless about changing your comp settings until it is just right. But boy-howdy does it pay off if you do it well! I'm here to tell you that we made a real difference in an already-great sounding CD doing this.

If there is a native plug that would help here I would LOVE to use it and save all this work making the band-split tracks. Let me know.

I will tell you this, that done well, this process is spectacular sounding.

Mix cleaner. Do not push PARIS so hard and leave yourself something to work with at the mastering stage. Pushing PARIS hard with the 8 band-split tracks and the comps on sounds terrific and is very controllable.

I used Sakis recommended bands as a great starting point. (Use the steep rolloff-hipass or lopass filters rather than the shelf)

They are:

Lo 30-90hz.

Lo-Mid 90-540

Hi-Mid 540-6Khz

Hi 6-20Khz.

Do not push things when bouncing. Leave the channel level at 0.

Listen listen listen. This process should make things both more clear and bigger. If it gets muddy, you are probably hitting the compressors too hard. Take a stereo track you know well and spend an afternoon trying this out. (did I mention it was tedious?)

Those of you with native EQ plugs can probably do this in one pass, but I would still try it my way, just once and see if it is any better.

best,

DC

The live CD is DONE yes! Now I can go outside again...Thank you for validating my feelings. Gawd how I need a hug now!

;oD

Ozone.

<http://www.izotope.com>

NeilYa beat me to it Rich.

And thanks Neil - 5 / 7 / 9 / 11...done em all and made them sound like
4/4 - that's the hard part

Don

>I talked to M-Audio tech support about this today. the guy I was talking to was clueless about this but he said there's an lod timer still around who was with the company when these units were being made. He was taking the day off but he's supposed to call me tomorrow. I really curious to know if this unit will pass bit-for-bit. I don't notice an sonic voodoo going on, but long cable runs are a no-no with this. Eventually I'm going to get myself one of those FriendChip thangs.

Actually, when setup right, the opposite happens. The stereo image becomes much more solid and stable and quite improved.

Remember, the left and right settings have to match exactly. When you do this, it actually corrects for L-R level mismatches precisely because it is not doing the same thing on both sides.

If you add too much compression, what will happen is a tonal imbalance between the bands, not a stereo imbalance.

Try it, and you will see what I mean. The stereo image was much improved and solid and stable as a rock. Linked compressors would

not work for this.

DC

 some sort... I'd buy it! Thanks again for all the help along the way!!

What about a weekly post on a subject to discuss some technique / hardware/software
 on. For instance I've been reading about the Mside st. miking but I never

see (never say never) it used for drum overheads - why is that??

sue on a vocal
might be "ok" in one section ("No, no, don't fix it... leave
it - it sounds cool there!"), but "not OK" in others ("Lemme do
another take on that." "That's not very far off, want to see if
Auto-Tune will take care of it?", "No, not that one, lemme do
it again"). So, it's different, and I think some recordists
might find it frustrating, but I find it interesting.

NeilNot that I've done this but if all your faders are at "0" and you put each
channel into write mode does that not set the start level on each fader once
you activate write mode

Don

"John" <no@no.com> wrote in message news:448302b6\$1@linux...

> Thanks,
> JohnWhat uses do you have for wires? Below are a couple.

Input Wire receives audio from other channels or plugs

Output Wire sends audio to other channels or plugs. It passes through audio
to the channel it is instantiated on AND also sends it to a virtual wires
channel. Other plugs such as Key Gate can receive this audio signal and
use it for processing.

I've used it to route Aux FX back to strips for added EQ and Panning etc.
ie: chorus on an acoustic 12 string guitar panned to the opposite side

I've also tried sending all the drums to two

wav files. All of this surprised me until I listened to the .wav of Hold On. Right at the place where it stuck before there were 5-6 seconds with subtle crackles in the background. Then I ripped it to MP3s and the exact same thing happened, crackles in that section of the CD. I can't prove this but I think the software or the drive is doing whatever it can to interpolate a section of the CD while the CD player decides it's faulty. So, me and my computer geek buddy went back to the ISOs and burned some of the CDs with enough erros that we expected the players to start interpolating. They chunked very quickly. This answered the question that been going on in the back of my head for some time, why do computer drives often read CDs that CD players won't deal with? I think that's the answer, but I can't prove it--CD players are designed to be less error tolerant than data/audio drives in CDs. This makes sense because drives in computers are designed to deal with the deeper and wider error correction that a data disk would include so they would deal with more bad data because of the higher error correction. However, I can say with confidence that most CD players appear to bomb out very quickly when they start interpolating.

All of this is why I think the burden of proof is on the slow burning crowd. For a while the problem was the pits weren't deep enough until someone pointed out that the pits can easily be between 65 and 130 nm and work just fine. Now we're on to elliptical burns and other such like. My ears say no, the data says no, the theory says no, so I'm going to stick with no until someone can convince me yes on one of the three. I'm certainly not going to go against all three.

Except that 2/3 of them perceived the situation accurately.

Non sequitor? By your standards all of them should have seen Bugs. Yet, 2/3's were totally accurate in their perceptions. And of course the
