I also have a fairly complicated digital setup and use a Mytek for master wordclock. I do not run multiple parallel wordclocks and my setup works fine

and see if you can just go directly to the Pulsar Creamware card and switch

You are not using the Paris wordclock (which is not terrible). I thought the Creamware clock was considered ok, are you sure you will hear any improvement short of a very high-end clock? A Big Ben or Mytek would probably make a noticeable improvement. All the more reason to borrow one first. Is there a trick to looping in freeform? I'm only looping, no punch in but if I loop more than 2 or 3 times I get that ugly Tqueue type crash. Are there any tricks to allow for a bunch of freeform looping? Thanks, I have a lot to learn. I won't buy it if I have to do stems though.

It's a pain in the ass enough as it is.

>Logic doesn't support VSTi's. But does support Audio Unit (AU) plugins. For example, Native Instrument plugins come in both flavors. I believe Motu's Digital Performer supports both VSTi and AU directly.

On MacOSX you can combine hardware interfaces at the OSX Core Audio level, and any sequencer will see them as a single large interface. So pick and choose, either use one i/o box with enough channels, or combine several to get to the i/o count you want. The new Apogee stuff claims exceptional low latency on the Mac, so I'd look at that first. Or RME, MOTU, Presonus, Mackie, Yamaha, etc. your choice. I think firewire can go 20 feet, but you might want to keep the actual i/o in the control room and run a short XLR snake as far as you need from there. BTW, G5 (and AFAIK Intel) tower Macs are quiet enough to keep in a control room with only moderate acoustic shielding.

I think my biggest track count has been around 50 tracks on the dual G5 (with a ton of instrument and FX plugins), and it wasn't a hardware limitation but just a matter of the amount of musical excess for that one particular song. :^)

AFAIK, any of the current tower Macs should be able to handle your desired track count and more. Overproduction has never been this easy...

Comparing the way each sequencer sounds with large mixes is the challenge. You wouldn't want to just go solely on what someone else claims.

Get 60 example tracks on a hard drive and see if you can find a studio with each system, or a store with a decent demo monitoring setup (preferably for several different DAWs), and listen for yourself. If you have a really fast, recent laptop and one of the DAWs you could bring that into a studio and compare it against another DAW in the same

>ProTools HD3

It's the Industry standard

you'll have regular updates keeping you on the cutting edge of technology

without a doubt it is the essence of "today's sound"

You'll be the envy of all your "Project Studio" friends

You'll be able to sit back all comfy in your smugness knowing that all other players are in fact pretenders

ProTools HD3...it's the only way to go

>The problem with firewire/1394 has as much or more to do with chipsets than
anything. RME spec'd out which ones would work with the Fireface 800 -
stick to them and it works fine. If not, it's a coin toss. IMHO, 1394 in
general is a tough protocol for audio (and of course has slightly higher
latency than PCI based cards), but people make it work. Apple probably uses
TI chipsets, so you don't have the variability of different motherboards,
out of spec chipsets etc. that you do with PCs.

But fwiw, I actually use a PCI-based Digiface on my main system and have the
Fireface running off of a second PC - just for access to Totalmix. It's
standalone/lightpipied to the Digiface for audio.

Firewire and 1394:

Given the ;-) David I assume you were referring to Apple's "claim" on
inventing firewire....

FYI for anyone interested, I found this while researching this a bit: Apple only copyrighted/patented the name "firewire". Several companies had a hand in developing it including Apple, Sony, Canon, ST Microelectronics, Matsushita, National Semiconductor, RF Microdevices, ST Microelectronics. Apple may claim they invented it, but likely only because the two guys that developed the transceiver worked for Apple. However, the protocol and other technology that make Firewire/1394 a working protocol and medium were developed after these guys left Apple (some by them, some by other companies - hence the IEEE standards committee developed the 1394 standard. The royalties from "firewire" are actu
