I've been struggling with Autotuning for years. How much is too much?

I am curious to know if the pitchyness is obvious to you in all of the tracks
or just a few cuts.(on or off line). This is an issue that's hard for me
to do much about if the artists are okay with their performance.

Thanks to everyone for lending an ear. I really appreciate any and all feedback.

Best regards,

Jim

>
> <http://www.music123.com/Ensoniq-PARIS3-i228172.music> Can anyone explain this another way? I don't get it.....

If you want to edit across multiple submixes

1. Edit your first submix by cutting up all objects at the Now Line and deleting (or adding) them in unison until you have the right edit. Drag 'em around to taste, all together, until you have the best compromise edit.

2. Undo the Edit, returning all edited objects to their previous state, selected and ready to cut or add. Make sure the objects you're deleting or inserting are selected, and are all the same length, which they will be if you cut them at the Now Line.

3. Click in the Information Bar to Sel End (Selection Range) to find out the EXACT LENGTH of the objects you've cut/ added.

4. Go to Insert/ Delete Time and enter the exact time stated in the Information Bar thing that's been hidden from you lo these many years.

BOOM. You're done! Just like that! All your automation, all your markers, all objects in all editor windows, everything has been moved exactly the way you wanted. their whole site is dead unless they sold the entire company...hehe

RK,
I've never used an out of phase signal for this purpose. I have used something similar though. Copy lead vocal track to an adjacent channel, pan each hard lft-rt, move the left track a = millisecond or even less back in time. The vocal should widen without sounding processed. Keep their faders equal level. Your ear will naturally hear = the earlier track (lft) first and perceive that it's louder.

-----=_NextPart_000_0146_01C61174.3CC1A500--So you hook the BNC from the MEC out
 (external clock) into the 442? I'm

confused as to how Paris interprets this and what the end result is.
Another 4 inputs? Can the 442 be assigned to submix 2 while the MEC is on submix 1?

Do you need to configure anything, or will Paris automatically pick it up?
Are you using any special type of BNC cable (I think there are a couple different kinds?) Who is John Galt?

Kent This is a multi-part message in MIME format.

ke sure there is somewhat of a hole around the vocals so that they
fill that void or hole all by themselves.

A quick trick is to throw the mix in mono and see what you hear...if the
guitar or piano is interfering, try a new level or re-EQ the offending
instrument so it backs off enough to give the vocals their space.

Doubling or tripling work (with appropriate time delay)...adding a chorus to

the third can help...compressing a copy of the vox track and blending to taste might work..and the above suggestion will work

YMMV

Don

Kent,

I'm in the Boston area. I know there's a bay around here somewhere...

There's Tom Boyles and Tom Bancroft too.

The other Tom

Cool, I'll give that a try.

Tom, didn't you used to be down in the Bay Area? I'm just getting =
back into Paris, but I thought you were trying to get a Bay Area user =
group going a couple years back. =20

Kent

"Tom Bruhl" <arpeggio@comcast.net> wrote in message =
news:43bc8234@linux...

RK,
I've never used an out of phase signal for this purpose. I have
used something similar though. Copy lead vocal track to an
adjacent channel, pan each hard lft-rt, move the left track a =
millisecond or
even less back in time. The vocal should widen without sounding
processed. Keep their faders equal level. Your ear will =
naturally hear the
earlier track (lft) first and perceive that it's louder. If you =
feel that's disconcerting=20
try raising the right to level it out. This may decrease the =
effectiveness of the=20
process though.

Another way to get it to sound more present is to double
compress the track with comps in series but only reducing by 2 or =
3db each.

Sometimes a third comp is needed along with level automation. The =
idea
is to not hear pumping but have a fairly steady state level to the =
vocal.

This will allow you to get it to ride on top of the mix without =
jumping out
to bite you.

"RK" <kent510745@hotmail.com> wrote in message =
news:43bc7a43@linux...

Trying to get lead vocals to jump out of the mix and I remember =
a trick

listed somewhere telling you to copy a vocal track to a =
different track, pan
tracks left and right, then reverse the phase on the second =
track and slowly
bring the fader on the second track to meet the other track =
fader at 0.

Seemed to work, but the effects seemed to cancel each other out. =
Does
anyone use this, a

>Hello Jim,

Welcome to our neck of the woods. The easiest thing to try is cooling, open the case and put a fan on high. Test your Paris setup and push it.

It is probably heat and a weak power supply. 450 watts or so should do the trick.

Regards,

El Miguel
