>Thad,

I'm still summing in Paris right now so any Scope plugins are "post" Cubase SX/VST. My routing matrix is Byzantine and involves routing 48 ASIO sources to the SPF 48/96 mixer (or whatever it's called), then sending these individual tracks from the mixer direct outs to 48 Pulsar ADAT destinations which are physically patched to 48 Paris inputs. 40 of these are routed 1:1 to individual Paris tracks. The other ADAT source is physically patched to an RME ADI4-DD which is interfaced via AES with 4 x external FX processors and configured with Aux busses 1-4 of the Scope mixer and physically patched to a Paris ADAT I/O which is routed to 4 Pa

ris aux busses on a card submix
in the Paris virtual patchbay so that any of the 40 audio tracks that are being streamed via ASIO from Cubase to the Scope mixer can be routed to any or all 4 of the external processors and processed in parallel via the Scope/Paris aux.. I've also got the analog I/O of my A16u set up as external inserts in Cubase.

sorry.....but you asked. ;o)

I've been thinking of getting some kind of mix automation happening via midi with the Scope mixer, but haven't gone there yet. I've never done this before and it makes my head hurt, but everyone says it's easy. I'm currently a midiot and the thought of another learning curve right now just makes my head hurt.. When I finally give up summing in Paris, I will likely be wanting to get into this though.

t to try using a VST/DX wrapper. This *might* solve your problem. not sure though. Liquidmix is new territory, but if you can get this working, I'd be interested to see what kind of latency numbers result.

thousandth as tricky as your current audio routing. If you have problems
I'm sure I'll be doing at least SOME of that myself so I'll be happy to help.

What would be nice is if one could load VST f/x into SFP or even better if
SFP could run as a ReWire slave. Now THAT would be a real improvement.
