```

Actually, a newer NIC card will use 3.3 volt signalling, and the PARIS cards use 5 volts. It could be that you MB is feeding the EDS cards bad power - maybe even 3.3 volts. Try the EDS cards in another PC. That's really the only way to know if they are cooked. I doubt that they all could be. Actually, low voltage would make any card act weird. High voltage would work fine until they popped.

Tom, if you give up on this, I need you to send me one of your EDS cards, because I just have to know!

Good luck!

Mike
