I card or something, with the mac flash and it worked.

Example, Steve Cox is using a PC version of a video card in one of his G4s.

We know what your thinking Dr. Frankenstein!

s that the rumor that apple has been delayed because of Vista incompatibility, is untrue.

Like I say, I would never buy Apple upgrades or their monitors, because they are just way too expensive. To be a little more fair, compare you MOBO prices to Intel MOBO prices, because that is what Apple is using. They also have the cost of their proprietary Apple ROM chips. The truth and the bottom line is, Apple will never be able to compete with the roll your own PC pricing.

I think they will even have trouble competing with Dell at times on some things. It's supply and demand.

James

it should invalidate your warranty but they will say (this is what they told me on my old g4) that once you install any soft or hardware and if the computer fails to function properly (even though others do with the same) it's your fault or the fault of the components or the fault of the weather but not their machine.

the last place i would get ram from is apple. there's nothing special about it other than they've tested it and it works. you can buy the same ram from just about anywhere for 1/4 the cost.

That is a good technique. That's what we did on "God Is Asleep" . . . real violin, flute, and oboe over sampled stuff. :)

SThanks everybody for the input. I think I'll go with the bundled GPO, at least for the time being. Sounds nice and simple. :)

Love all y'all,

Sarah

>Yes, the DA7.com forum. I own a DA7 MkII. It is digital desk that when it
came out a few years back, it listed for \$15,550.00. Some poor soul who didn't
pay his pawn ticket in Texas is probably a little upset to loose the desk
for \$700.00 I inserted it quickly into my 10 ft console. Another cool thing
that has happened to the studio. You know the 10 foot Argosy cosole (with
no equipment in it)? Goes for I am guessing between 5-\$700.00, My dad is
a cabinet maker and built it for me as a gift, but with a 9 inch X 9 inch
elbow resting pad. Great for sittig the guitar pods and such on.(n' music
scores n' such) Cooler yet, he built it so the partitians between mixer bays
are movable. It is extreamly flexible. So when I got the DA7. I put the Mackie
8 buss on the left side, it's 24 ch expander board on the right, and plopped
the DA7 right in the sweet spot... the middle.

t sounded really pretty rough, definitely no better than demo quality, and I didn't even use any of the (very good) creamware reverbs because I didn't want to hassle with the routing and all. So I send it over kind of feeling bad because it really needs a few more sessions to buff it up but at least it's giving some kind of window into what I can do sonics wise in my mixing room.

So, today I get a sheepish email from the other two main Monkies explaining that it was just 'too polished' for their taste.

Guess I won't be mixing any Monkies tunes ;-)

TCBI'd suggest VNC personally, it's what we usually use where I work. I just don't trust M\$oft to deal with the security right.

Also, it's free as in beer and speech,

>JamesThey must be used to the latest Neil Young live album that had to be mixed on an answering machine. What are you looking for, fidelity and dynamic range or loudness? You will

sacrifice one for the other in the end. However, if your program material tends to lend itself to midrangey'ness (and what program material doesn't?) and you've gotta' have *loud*, then RMS normalization or judicious limiting with as transparent a limiter as possible is where you're going to need to go eventually. This is in the realm of the mastering guys. I'd suggest pinging DC or Sakis on this. They've got a better handle on it than I do. The way I do it here involves meticulous attention to getting as much balance as I possibly can in the mix so that when I apply the limiter don't have to EQ my two track until it gets *really* loud, then compensating for the loss of top end by using as much subtractive EQ as possible (or a multiband comp) to bring it back into line (which doesn't always work) and then, once I get my *air* back into the mix, applying another limiter at the end of the chain to catch any overs that might be happening because the subtractive EQ, etc., didn't give me what I need and I had to boost some things to get the top back, then adjusting the EQ and limiting yet again

because the limiter that I put at the end of the chain started *messin' with the top* that I was able to create with the EQ/multiband, etc . After a while, I can usually end up with a stereo master that sounds enough like my mix, but *MUCH LOUDER* that I'm happy with it because it will jump out of the speakers and stand up on it's hind legs and bark with the other dogs, but kind of loudness fatigues my ears after a while (but all masters seem to do this to me these days though) this is probably why I'm not a mastering engineer and someone else is. Also, I have to take into account (and convince the client) that he may not want this master to be quite as loud as he thinks because if it ever gets airplay, there will be more compression/limiting done at broadcast time and it's liable to just sound like a dronetone if we squeeze it to death before it gets to that stage.

I much prefer to work with clients who don't mind turning up the volume on their stereo to achieve loud.....but that just ain't *radio ready* these days.

;o)

>after 8 months i and the dealer were dealing with the higher ups. it was they who told me the news. remember i had the logic board, cpu and boot drive replaced twice by them. rather than admit the ff800 made only for one month prior to the g5 just didn't work right until 10.3.7 came out.

as to configuration support...i guess that would be logic and the ensemble...and fuck the rest of the world.

i guess i'd have to see the special engineering they have as any bench marking we've done with both apple and non apple ram show no difference other than price.

outsies, and has a cable that attaches to a plug assembly on
the DSP card. It enables you to slave the pulsar card to
external devices, or have it act as a master clock for external
devices. It fits in a PCI slot for the purposes of mounting it,
but has no actual PCI bus connections. They're normally about
\$200 street price.

>You plug it into Cubase & try to see if you can get it to run
any of the controls therein. Normally this is done through
various MIDI ports & settings.

Deej - is it on the list of Controls surfaces/devices when you
pull down that submenu? (too lazy to boot the DAW & check for
myself right now LOL!)

Neil

a major highway there last night. I saw the flames from several miles away,

but the weather was great.

RealVNC has some security issues.

OSX has a vnc server built in.

On the client side:

For Windoze machines, I use TightVNC client
For my MacBook Pro, I use Chicken of the VNC

Both work very well.

If you're vnc'ing in from windows into Mac, you'll have to remember that the keyboards are different and use the "alt" key instead of the squiggle key and remember that "backspace = delete". Once you map your brain for the differences, works like a champ. I have my Quicksilver on 24/7, with a static IP address, and my router set up for port forwarding. I picked a ridiculously high, random port instead of the default 5300 to thwart port scanners. I also registered a DDNS domain with dyndns.com pointed to my DSL address (it's pretty stable, plus my router can sense changes and will notify dyndns.com)

I can vnc in and check my email and IM from any computer that will allow me to run an executable.

Oh, yeah - TightVNC (Also UltraVNC) viewer is a standalone executable. Nice.

pabDoug Wellington is kind enough to host this for us...

Many people have and do use the PowerMac G4 800 with no problems, including Audio guys, so.....I don't know what's up with that.

I don't know when you bought your G4 FW800. The power Mac G4 FW 800 was released at Macworld in January 2003, and was discontinued in late June 2003, so about 6 months. This wouldn't be considered short for a PC model.

Oh, does Microsoft and Dell support Steinberg, cakewalk, RME and Presonus configured on their products? How about the slapped together PCs? Nobody can or will support every configuration. Your kind of being unfair.

DJ was talking about the RAM that goes in the Intel Mac Pros. It is different than standard RAM in that it has a heat sink on the memory. Look on page four, it's not standard memory. You can buy cheaper memory from third parties like I said, you don't have to buy the high priced Apple memory.

>Did Al Gore show up for a photo opp, and say the fire was a result of global
warming?

When he gave a speech and said the grass fires in florida that were caused
by lightning were the result of global warming, the people wanted to run
him out on a rail.

Sorry Gene, just cracking a joke, not looking for a debate;)

Hope you had a good time down there.

>The planet is actually warming, according to measurements.

Could that trend make grass dryer and lightning more common in some areas? Possibly.

But the main thing to realize is that a warming planet will experience a variety of changes in climate, influencing things like weather and average sea level. Some of these changes may eventually make things difficult for various species, including our own.

This is true with or without Al Gore.

But joke away anyway, Al probably has a pretty thick skin by now.

Cheers,

-Jamie

cycle variation, like el nino or some other climate cycle.

In short, it may be too soon to tell if some aspect of the fires are currently being influenced by global warming yet. But I wouldn't rule out the possibility.

fuck the rest of the world is more for now. they're position was anything anytime not working was due to the "other" and not them. when os updates make some mfgs. ram no longer compatible the wtf. even though it was mac's doing they were blaming others for their short comings with firewire and it's working with outside produced gear. then later (years) admit it's theirs.

why you keep dragging pc's into this i don't know. the discussion here was about a mac. i effing know that one can and does encounter problem with compatibility issues with certain mobos and gear. but you don't see posts pulled by other mfg's. the way you do mac. if there's a negative post or topic they are most likely to be pulled by the mac moderators.

memory with heat sinks is hardly new and not a mac invention. i've had that on my mushkin ram for years before mac "invented it"

I did have a good time, thanks.

to:
<http://www.columbiarestaurant.com/ybor.asp>

A little touristy but highly recommended.

The fire was a gas truck that caught fire on an elevated highway. No Global Warming involved as far as I know.

has been involved in a multi-year publicity campaign of disinformation, and most people cant help but believe what they are told by our government, particularly

Gene -)

---=_linux460d0a1e--My demo works fine, I guess, but the controls are not the most intuitive I've ever seen in an EQ. It also seems to impart a little bit of grunge to the sound. Mostly I've been trying it on stereo mix files. It doesn't really seem like a great mastering tool. Maybe I'll import some multitrack files from Paris into DP to see how it sounds on drums and other instruments.

Since I can't use it in Mac OS 9 I can't use it in Paris.

(859) 635-5762 It stopped yesterday afternoon and all melted. We've got 4" on the ground this morning and it's still snowing hard, and I mean like as in a January snowfall. I'm glad we didn't curry our horses last weekend. That removes their winter undercoat and they're needing it today. I had a feeling it would be a good thing to wait. I was right. They're out in the pasture right now looking around wondering where all the green grass is that they were munchin' on yesterday.

Time to go throw some hay at these guys
;o)

The first FU is the fact, at least from looking at the demo, it appears that the drum track determines the tempo of the song. You need to be able to set the tempo to whatever you want and have the tracks snap to that tempo. It may be able to do this, I don't know, but it needs to be able to do it automatically, without jumping through the hitpoints/warping hoops or anything else. Drag it, it nails to the grid and so does everything else. Otherwise, what's the point? there are plenty of proggies out there for this now.

I thought Al Gore invented itThis raises a question that I've been wondering about for a while now
- What

is the most recent version of the UAD-1 FX you PC guys are able to use?
Can the Neve EQ's and comps run in Paris on PC? On Mac we're stuck back
in UAD-1 v.3.9.

itinerary. Berns Steakhouse did make the cut, as did Dempsey's Steak House

Genelf I could I would...in a heartbeat but unfortunately we have some major house expenses coming up that will require the temporary maxing out of the cards in the event financing of said expenses gets held up....now should the financing come through and your card is still available I'm sure we can work out a amicable arrangement i.e. I give you cash, you give me card(s)

:~)

I followed your instructions (and theirs) to get this working.

I have a problem with my Pultec Pro authorization

also. Maybe something went wrong at my end.

I'm giving them a call shortly.

Tom

Its still more of a alpha version. It's gotta a while to go before it
works the same as the PC version. I think he might be trying to get them
both be in sink with the 2.0 versions.

Well with the new Pro version coming out you should probably ask around at stores for deals that might have over stock of the old version. Or ebay for them.

If This guy Jason keeps developing Reaper, and keeps the price the same,
all the other companies are going to have problems competing. Who is going
to want to pay a thousand dollars when you can buy Reaper for \$39.00?

His development for Mac OSX seems to be rapid.

Now , if we could only get him to develop Reaper for Paris.....I Know, Shut up.

>(859) 635-5762Hi peeps.. hope everyone is well...

Well.. I took the leap. I was able to get a screaming deal from a little studio in SF on a 5 month old, low hour DM3200 with a meter bridge and I'm now deep in the throes of trying to understand it all and learn Cubase 4.

The new firewire card is still only marginally available and waiting on one but I picked up a used MOTU 2408mk3 to use in the interim. Having some clocking issues right now so I'm sure you'll be hearing from me...

Thanks again to everyone for all of the advice..

Party on Garth,
JonSo Mr. Ludwig,

What CPU/Ram combos would you suggest with this board for best stability with Cubase 4?

Thanks!

jj

It's a British documentary showing another viewpoint about global warming
and CO2. It's a viewpoint that is different from that of the man who
invented the internet...You will probably like it, once you get the hang of it. I had a DM 24 for
several years and it was very useful. Not the greatest sounding components

(mic pres and converters), but adequate with external pres. I don't doubt the 3200 is better, especially in the converters - they seem to get better and cheaper all the time. It is VERY nice to have all the routing a real console gives. i really missed that after I sold my my old Matchless.

Have fun with the manual!

Bill

lobal warming skeptic. He started a non- profit in Canada (the Natural Resources Stewardship Project) from which he and Tom Harris (NRSP head) are well paid.

The Canadian federal Lobbyists Registration System indicates that High Park's clients (NRSP) include the Canadian Electricity Association and the Canadian Gas Association.

The Toronto Star Newspapers have done several articles outing the NRSP as a shill for Canadian energy giants.

Do a little research before you jump on board the energy-backed misinformation train.

Some info here:

http://en.wikipedia.org/wiki/Timothy_F._Ball

http://en.wikipedia.org/wiki/Natural_Resource_Stewardship_Project

These people will never stop finding people willing to take money to spread the falsehoods.

Mr. Steven Green
Head of Production
Wag TV
2D Leroy House
436 Essex Road
London N1 3QP

10 March 2007

Dear Mr. Green:

I am writing to record what I told you on the telephone yesterday about your Channel 4 film "The Global Warming Swindle." Fundamentally, I am the one who was swindled---please read the email below that was sent to me (and re-sent by you). Based upon this email and subsequent telephone conversations, and discussions with the Director, Martin Durkin, I thought I was being asked to appear in a film that would discuss in a balanced way the complicated elements of understanding of climate change---in the best traditions of British television. Is there any indication in the email evident to an outsider that the product would be so tendentious, so unbalanced?

I was approached, as explained to me on the telephone, because I was known to have been unhappy with some of the more excitable climate-change stories in the British media, most conspicuously the notion that the Gulf Stream could disappear, among others. When a journalist approaches me suggesting a "critical approach" to a technical subject, as the email states, my inference is that we are to discuss which elements are contentious, why they are contentious, and what the arguments are on all sides. To a scientist, "critical" does

not mean a hatchet job---it means a thorough-going examination of the science. The scientific subjects described in the email, and in the previous and subsequent telephone conversations, are complicated, worthy of exploration, debate, and an educational effort with the public. Hence my willingness to participate. Had the words "polemic", or "swindle" appeared in these preliminary discussions, I would have instantly declined to be involved.

I spent hours in the interview describing many of the problems of understanding the ocean in climate change, and the ways in which some of the more dramatic elements get exaggerated in the media relative to more realistic, potentially truly catastrophic issues, such as the implications of the oncoming sea level rise. As I made clear, both in the preliminary discussions, and in the interview itself, I believe that global warming is a very serious threat that needs equally serious discussion and no one seeing this film could possibly deduce that.

What we now have is an out-and-out propaganda piece, in which there is not even a gesture toward balance or explanation of why many of the extended inferences drawn in the film are not widely accepted by the scientific community. There are so many examples, it's hard to know where to begin, so I will cite only one: a speaker asserts, as is true, that carbon dioxide is only a small fraction of the atmospheric mass. The viewer is left to infer that means it couldn't really matter. But even a beginning meteorology student could tell you that the relative masses of gases are irrelevant to their effects on radiative balance. A director not intending to produce pure propaganda would have tried to eliminate that piece of disinformation.

An example where my own discussion was grossly distorted by context: I am? shown explaining that a warming ocean could expel more carbon dioxide than it absorbs -- thus exacerbating the greenhouse gas buildup in the atmosphere and hence worrisome.? It was used in the film, through its context, to imply that CO₂ is all natural, coming from the ocean, and that therefore the human element is irrelevant. This use of my remarks, which are literally what I said, comes close to fraud.

I have some experience in dealing with TV and print reporters and do understand something of the ways in which one can be misquoted, quoted out of context, or otherwise misinterpreted. Some of that is inevitable in the press of time or space or in discussions of complicated issues. Never before, however, have I had an experience like this one. My appearance in the "Global Warming Swindle" is deeply embarrassing, and my professional reputation

has been damaged. I was duped---an uncomfortable position in which to be.

At a minimum, I ask that the film should never be seen again publicly with my participation included. Channel 4 surely owes an apology to its viewers, and perhaps WAGTV owes something to Channel 4. I will be taking advice as to whether I should proceed to make some more formal protest.

Sincerely,

Carl Wunsch
Cecil and Ida Green Professor of
?? Physical Oceanography
Massachusetts Institute of Technology

cc: Hamish Mykura, Channel 4

(Hard copy to follow)The fossil fuels lobby would love to make this about Al Gore instead of about global warming. Because then anyone who doesn't happen like Al Gore might be more inclined to buy their spin.

If you don't happen to like Al Gore, check out the actual science. Try and avoid the spin from the fossil fuels lobby if you can. Stick with facts and assess the risks yourself.

Here are a couple of useful web sites:

Google it to check out the story behind it. Fair and balanced it ain't.

I do like the breathless announcer, fast cuts and dramatic music. It's always fun to see a one-sided polemic that ironically accuses others of being one-sided. I doubt anyone here is gullible enough to take it as an objective authority.

Cheers,

-Jamie

http://observer.guardian.co.uk/uk_news/story/0,,2031455,00.html

Here is a response to the smear campaign against the movie from the filmmaker himself. There is a direct response to the point you raised.

http://www.nrsp.com/NRSP-Media/Audio_Wave/Martin%20Durkin-15-03-07-Charles%20Adler.wav

DCGlobal warming is very real IMO.

Even the people in the fossil fuels business (me, for instance) know that

they produce sulphur based pollutants and CO₂. The only way, IMHO, to explain away global warming is to explaining away the theory that CO₂ doesn't cause it. I ain't buying that one. Those who try to compare what is happening now to what has happened in the past with climate change are missing one serious fundamental.....never in the past have there been so people on this planet burning so much carbon and never before have we had the science to live as long as we do now, and for our spawn to survive the in such staggering numbers. Also, if you stop and think about it, up until 50 years ago, we had major disease epidemics that culled the global populations drastically and systematically and some pretty devastating wars on a fairly regular basis that also culled the population, especially in continental Europe and Asia, thus delaying the exponential population explosion that we have seen over the last 30 years or so. In 1970, the world population was 39 billion and change. right now it's estimated to exceed 67 billion. All of these folks are competing for and using vcarbon based energy resources (and farting on a regular basis ;o).

The solutions we're proposing right now are too little too late (again IMO) There are ways to reduce energy consumption but this will add to the costs that none of us want to pay. At some point, diminishing returns will be reached and alternative energy sources will start look more competitive. The bigger problem is that the point of diminishing returns is quickly being reached as far as global supply is concerned (yeah....that peak oil voodoo...too bad it's as real as the day is long). This is already the driving factor in our effort to survive in the brave new global economy. It's gonna be expensive no matter what though. We are already starting to see the price of products based on corn as food to rise as the shift to ethanol starts to ramp up. the only way to sustain anything like the economy we have right now and become energy independent would be to build new refineries here,, build coal fired power plants, nuclear energy and drill every drop and bubble of oil and natural gas that we have here within our continental soveriegnty while rolling huge amount of the revenue from the sale of that to alternative energy R&D. Big problem there.....the energy interests won't do it and the environmentalists won't do it so we're gonna be hosed in 20 years, if not *much sooner*.

the real problem is that there are just too many of *us*. I think we're getting ready so see some stuff right out of the worst imaginable horror movie that the most twisted mind could dream up.

Mother nature has always had a way of levelling our karma and our doomsday religiosity will do the rest. I've always believed that things happen if enough energy is directed toward the particular end one is trying to achieve. Well.....lots of folks believe that Armageddon is inevitable and by god, it's our duty to make sure that it happens the *right* way so that you go to hell and I don't.

shit!!!!....where'd I put my meds?

;oP

here and point out that the majority of mathematicians feel that $2 + 2 = 4$.

Breast implants reduce cancer. I love it.

You should read a little about Martin Durkin, the man you are defending. Gene,

No matter what we say to each other here, the whole thing is out of our hands. What troubles me is that we who grew up in the 1960's learned to rebel against Nixon, but we drew the line at Gore and Hillary didn't we? How did we get so many sacred cows?

What if these scientists are right?

Remember,

>>Hi Gantt,
They can but it is very dependent on the chipset used on the cardbus
controller.

Unless you stumble across a chassis used on EBay you might as well just
buy a desktop to do the Paris thing.
Magma and other units go for \$1500 plus when New.

There are no motherboards that are currently being made that AFAIK have
been fully tested with Paris hardware.

Most everyone is using stuff from a bout 2 years ago.

The GigabyteK8NS - Ultra-939 that has a AMD X2 CPU works well for DJ.
That is probably the newest board you will find and it is only available
used of refurb at this point.

Also anything brand new will have at most 3 PCI slots. The rest are
PCI-e. So if you have a more than 2 card Paris system your SOL.

Chris

>(859) 635-5762 There's lots of stuff I can't talk about because of my job, but this is a very good book that says some of the same things but draws slightly different conclusions.

<http://www.amazon.com/Thousand-Barrels-Second-Challenges-Dependent/dp/0071468749>

I met the author and had a long discussion with him, and he knows his shit.

TCB

P.S. The only good thing that just might possibly come out of our current middle eastern meddling is that if we do start a war with Iran, and they do choke off the oil tankers, and gas does go to \$15 per gallon it will be a hell of a spank on the US economy but we might finally get serious about conservation. And I don't see Iran going gentle into the night, they call that piece of water the 'Persian Gulf' for a reason. Anyway, that's a good book.

Gantt,
Chris IS THE MAN when it comes to this. Have him build it
for you if he will. He makes everything work like it should.

He works at ADK.
<http://www.adkproaudio.com/>

For Paris you'll want him to build something that isn't listed on
the ADK list.
Tom

-----= NextPart_000_0026_01C77457.2F4ADA80--Chris,

I never did use the K8NSU 939 with Paris. The Aussie Kims both use these with Paris however with AMD 64 3700 single core CPU's.

I had great luck with the ASUS A7V8X mobo and an AMD XP 2800 CPU for 3 years. I'm sure you could go to an XP 3000 CPU with this mobo.

I know the Naysayers will just say nay, but you should read this:

<http://www.cnn.com/2007/TECH/science/04/01/climate.report.ap/index.html>

Personally I think we should just argue about the science for the next hundred years or so. Then the people standing in the way of doing something about it can simply claim that it would have happened anyway, and the people that

I will be gone when the shit really starts to hit the fan in about 50 years.

"The worst stuff is not going to happen because we can't be that stupid," said Harvard University oceanographer James McCarthy.

This is the optimistic opinion of a person who does not frequent the Paris users group.

Gene :-(Hey Folks,
Ok with Gantt's current dilemma of trying to use the newer UAD stuff.
I;m getting the itch to see if I can get Paris hardware/software to work well on new PC hardware.
I obviously have access to the PC hardware stuff and I have PCI-e and PCI UAD cards to use (we build some of UADs in house test machines).
So if any wants me to take on this test I'll need some Paris stuff sense I don't have anything now.

Here is what I'd need as a minimum.

2x EDS cards w/ sync cables

2x MEC with data cables

2x C-16s

Expansion 3.3

If anyone wants the XP ADAT issues tested then I'd need some ADAT cards.

Thanks,
Chris

(859) 635-5762 Unfortunately I don't know enough science to analyze the whole scene and draw my own "scientific" conclusions. That said, I do find one specific datum from the movie compelling: that historically the CO2 has risen AFTER the warming. If this is indeed true, then one would have to be a fool to believe that increased CO2 emissions will greatly cause global warming. Surely we are all smart enough to acknowledge that.

A key question is: historically, which came first, the warming or the CO2 increase? Who can unequivocally determine that?

weeks...and if I can do the ADAT cards I'll send along a MEC as I won't be needing the second one if the ADAT cards are gone.

Two questions...where are you located and about how long will you need the gear

DO n

One thing to think about here Don.....deforestation.....the planet
used to be covered with plants that utilized CO2. CO2 may constitute only a
small portion of our atmosphere, but it's a critical part of the atmosphere.
When you talk about *almost insignificant* things, a 3 degree F rise in
global temperature may seem insignificant in and of itself, and the
inundation of 60 miles of continental coastline that this could create may
seem insignificant when you consider that 60 miles is insignificant when
you're talking about a continent that is over 3000 miles across, but also
consider the fact that a huge portion of the earth's population lives within
that 60 miles and since water tends to adhere to the laws of gravity,
depending on the topo in these various areas, this 60 miles is gonna just be
a drainage area for waterflow seeking the lowest point which means you'd
best start buying beachfront real estate on the eastern edge of the Mojave
and the Appalations.

A little goes a long way when you start jacking around with the life support
system of a living organism and the earth is a living organism. We're just
sorta' starting to behave like a malignancy within that organism. A *almost
insignificant* tumor can kill you. Suppose someone strapped a respirator on
you and started mixing in elevated levels of CO2 at higher temperatures than
98.6 degrees, thus alterering the basic composition of the gases you needed
to survive and warming your body to the point that you basically were

running a fever 24/7, and you had to breathe this to the exclusion of anything else. Depending on how drastically the CO2 was increased, you might survive and eventually adapt, but you would initially be weakened by the imbalance of the toxic gas and the fever and the this weakening would likely hamper your capability to evolve an adaptation to the new environment. Now add that to the fact that as you are weakening, the CO2 levels and temperature in your environment are being constantly elevated.

Maybe a good thing (not for us, but for everything but us) is that our population density is getting to the point that we are fast becoming a petri dish for some new bugs out there that could be considered by some to be the earth's immune system. When the "bird flu" white cells start travelling through the earth's aerial circulatory system that Boeing, Lockheed, Airbus, et al has so conveniently provided it, all but the "resistant strains" may get whacked. Chris,

I have a MEC and an ADAT card here I can send you. Nobody wants them anyway.

;o)

Bill, you can read a good explanation here:

<http://gristmill.grist.org/story/2006/12/22/231145/76>

In short, they can be interrelated, and the biggest driver in the end is the CO2. IOW, it fits into the picture we're getting, that humans are now contributing to the current climate change.

If you can't draw your own scientific conclusions, it may make some sense to listen to the conclusions that actual climate scientists are drawing.

Cheers,
-Jamie

www.JamieKrutz.com DJ,
Is the ASUS A7N8X any good for PARIS? I can get this mobo and a AMD 2400+ CPU and 2x 256 DDR Ram (PC3200) for \$30

respect

The A7V has a VIA chipset. the A7N is an NForce chipset. I don't know much about the earlier NForce chipsets and Paris. the old via choipset worked just fine. For \$30.00 it might be worth a try.

>I have posted about his in the past. This is the 800lb gorilla in the room.

<http://environment.newscientist.com/article/mg18725124.500.html>

Unfortunately, most forecasts do not take the methane leaching properly into account, so the acceleration will probably be faster than most climatologists currently predict. Don,

To follow up on my last post in regards to deforestation, prior to the last 10 years or so, I spent a goodly part of my life in southern Mexico. I have watched as the area has changed from what was once a paradise to an environmental trainwreck. This happened just between 1970 and 1995.

<http://www.planeta.com/ecotravel/mexico/mxforest.html>

I haven't been back down to that part of the world since 96 but I still have quite a few friends there and we stay in touch on a regular basis. If you are interested and want the scoop on what is happening, this is a good source of info.

<http://www.realoaxaca.com/>

Stan seems to lean a bit to the left on many things, but he's that way for a reason and he's a good and honest person. His monthly newsletter is usually consistent with what I have seen and experienced there for many decades, which is a real eye opener for those of us up here north of the Rio Grande who may care to question why things down there affect what's happening up here.

Regards,

Deej

> That's a good description of the straw man argument being put out there,
Don. It sounds plausible but it's a diversion.

Here's why:

The earth's climate HAS changed dramatically over time. No one is

claiming otherwise.

There are and have been a variety of causes. No one is claiming otherwise.

The science shows this clearly.

Setting up a straw man that no one is advocating and knocking it down decisively may seem like a winning argument, but it's a fake argument from the getgo.

So OK, right now, as in the past, we know that there are many drivers of climate. Everyone agrees on this point.

However, today, unlike in the past, industrialized humans have joined the list. The data shows human contributions to greenhouse gases.

The reason carbon in the atmosphere is important is that it sticks around and accumulates for long periods of time. Unlike, for example, water vapor which comes and goes on a quick schedule with evaporation and precipitation.

Scientists have spent a long time and a lot of effort looking at all the major suspects and so far they are not enough to account for the recent warming trend. Whereas atmospheric carbon from human causes does account for it.

How can what may seem like a relatively small amount of CO₂ cause an effect in a larger system?

As a mental example, consider a physical system that is in balance on a pivot point. Even if it's a very massive system, a small amount of force on one side or the other of the pivot point can change the balance.

The result of all our research so far gives us reasonable insights into what may be going on in the atmosphere and how our activities may be a significant cause for the changes we are now measuring.

That knowledge offers us the chance and the responsibility to future generations to choose how we want to affect our home planet over time.

We can be informed and proactive or we can sit in willful confusion and let the situation deteriorate.

Our choice.

Cheers,
-Jamie

Only one problem DeeJ nobody's talking 3 degrees..it's all about 1/2 a
degree over a hundred years, which could be a naturally occurring event yet
no one wants to admit the possibility because well, Global Warming is a big
business now

As for deforestation being a problem I agree but here in Canada most of our
logging companies have bought into the "replant what they harvest" mind set
(although I could be wrong) so we're doing our part at least from what I've
read (and yes there are exceptions so please nobody jump down my throat)

Ya lost me on that one...but it's going to take a heck of a lot more than 1/2 a degree change to drastically alter the chemical make up of our atmosphere as history has demonstrated over the millenia. This is not to say that we aren't facing some realities regarding Oil, Pollution, Water etc that have to be addressed and personally I think that we can do a much better job managing our resources and the environment and I for one do my part not to mention hound my various levels of government and business to get on board and start thinking long term Afterall I have kids and I'd like give them a planet in better shape than it is now.

Agreed...now where were we? oh yea. CO2

Is CO2 the cause of Global Warming...that's the multi billion dollar question.

Personally I don't think so...but then again WTF do I know

>(859) 635-5762First off Gene, that is not CO2 I'm looking at...it is a myriad of shit we humans spew into the atmosphere and yes CO2 is one of those ingrediants.

Can we do something about this overall pollution, damn right we can and we have the technology now to make a significant impact.

What we need is the political will and the almighty consumer to voice their opinion by demanding more from our governments and corporations as well as from ourselves.

Reduce, reuse and recycle are starting points, developing real alternatives for our energy needs is another starting point, motivating industry to clean up their act is another starting point...the list goes on and on but the bottom line is something can be done.

Jamie...I am not arguing that man is not contributing to the problem, obviously we are, but you are basing everything on a 100 year period that is granted "out of the ordinary" and insist it is solely man's contribution to greenhouse gases that are the cause. I just think there's more here than man's handiwork at work.

Any thoughts on that 11 year cycle of sunspot activity we just came out of...interesting that the two years of back to back El Nino/ El Nina coincided almost perfectly with the peak in sun spot activity between 1997 and 2002...could be a coincidence who am I to say.

And although I sit squarely in the nay sayers camp I still think we as a species had better smarten up pretty damn quick because global warming is only one of many things we're going to have to deal with

>Unfortunately, most forecasts do not take the methane leaching properly into
>account, so the acceleration will probably be faster than most climatologists
>currently predict. Hey Don, we agree that there is more than human effects at work. The key
point is that human causes could be adding to other causes to tip the
balance.

Solar causes are exceedingly important to climate. But the measured data
shows that changes in the Sun's output are not the culprit for the
current warming:

<http://gristmill.grist.org/story/2006/12/28/090/30666>

"According to PMOD at the World Radiation Center there has been no
increase in solar irradiance since at least 1978, when satellite
observations began. This means that for the last thirty years, while the
temperature has been rising fastest, the sun has not changed."

Based on current research, climate scientists are concerned with climate
changes that could be occurring due to human contributed greenhouse
gases. The changes could possibly accelerate due to other carbon sources
thawing and adding to the problem. We would be wise to pay attention.

Smaller actions now may be more effective than larger actions later.

I agree that something can be done, and your solutions are a good place
to start.

Cheers,
-Jamie
www.JamieKrutz.com

PS.

I don't know about sunspot data that may correspond with el nino/nina (ocean-based weather driving events), but if so it would be an interesting area for research, to see if there is a mechanism to ascribe any sort of cause/effect relationship.

We have two experts on climate here in Ottawa and both disagree vehemently that CO2 is the major cause of the warming trend we are presently experiencing. In fact one of them is a climate modelling expert and you should hear him rail against the models that are being used by the Global Warmists.

All I can say Jamie is we will have to agree to disagree but I'm keeping an open mind albeit a skeptical one. Hi Jamie,

I read the article, and it indicated that CO2 did not trigger the warming, but that it was part of the after/contributing effects.

I wish we would all work on positive actions we can take to handle the situation instead of what we must give up and stop doing and make amends for. People like to DO things not give up things. They like to CREATE, not reduce, and frankly it's better for them. I would much rather go on an exercise program than a low calorie diet. Telling a person to stop doing something is much less effective than showing them how to do something different and better (and hopefully more fun).

Let's work on creative ways to make positive changes in our world. One of the articles posted above pointed out that we will have more food production as an effect of global warming. Well that's a good thing, and we can capitalize on it by helping to ameliorate famine, but that's never mentioned by the blamers and takers-away.

Speaking very honestly, I would be OK with having fewer polar bears if the millions of starving people on Earth could eat a healthy diet. But ideally we can find solutions that don't harm anything, but actually SOLVE the problem, not just reduce all the bad things we humans are doing to the poor pitiful world. Let's get really smart and handle the hell out of it instead of tiptoeing around being all careful and apologetic. Let's have some fun!

><http://apnews.excite.com/article/20070401/D8O8326G0.html>OK,

Here's a question . . . let's say for a second there really is a scientific debate about the threat of global warming . . . what is wrong with "Better safe than sorry?" Doesn't such common sense apply to the health of the biosphere?

I hate to use the smoking analogy, but that's only because I didn't think of it first. :) I think it's a good analogy. The idea that inhaling tobacco smoke is unhealthy was around long before scientists in the '60s apparently convinced the surgeon general (or somebody) that "smoking may be hazardous to your health." Yeah, just maybe. My father quit immediately

when the warnings became official. My mother said, "Oh, nonsense," and died of lung cancer in the late '70s. As a nurse on a medical unit, I see the damage from smoking every day, yet there are still lots of people smoking, and even people who deny the health hazards!

Smokers seem to come in two broad categories . . . those who say, "I know I should quit, but I'm not ready," and those who say, "Ah, it's bullshit. My grandpa smoked and lived to be 99!"

Now scientists have put a big sticker across petroleum, gas, and coal, "Warning: burning of fossil fuels may be hazardous to life on earth." As with cigarette smoking, some of us want to quit right away -- why take chances? Others seem to be saying, well, maybe this is a problem, but I'm not ready to quit. Others deny the warnings altogether and light up another SUV.

The problem with the smoking analogy is that we can't just send the global warming deniers outside, like we do with smokers. Do we really want to wait and see if the predicted disasters happen and then go, "Damn, I guess we should've done more sooner!" ? I like Portland as it is, and I don't like the idea of it being on a little island off the coast of Oregon. If there's even a chance that Al Gore's Inconvenience is True, I say let's change things aggressively NOW.

But come on . . . there's way more than a chance. Isn't this really about resistance to change?

I have several friends who still smoke, including a couple of nurses. None of these people denies the risks, but I really think underneath it all they just don't give a crap. "Hey, everybody dies of something."

Is that what's really going on with the global warming "debate"? Is it really just a battle between those who give a crap and those who don't? I realize even planets don't last forever, but I think this one has a few good millenia left in it if we can get it to lay off the cigarettes. :)

I do not believe anyone here is stupid.

DCThey give a pretty compelling response to this in the movie.

Take a look.

Neither do I, but even extremely intelligent people can do very dumb things. If we all sit back and wait till its too late, we will have acted very stupid, regardless of how intelligent we are. There are many intelligent members of our government who are acting quite stupid on a daily basis. Being intelligent and acting intelligent are quite different things.

Everyone is entitled to his or her opinion, but we have only one Earth. If a few very vocal skeptics succeed in delaying the commitment needed to change the direction the environment is heading, those people will have done serious harm to the majority of people on the planet, even if that was not their intention.

If the environmental and scientific communities are right and the naysayers are wrong, the naysayers are fucking up my one-and-only World and I feel I should have the right to fight for it.

A major problem continues to be the millions that have been spent on the disinformation campaign. The energy industry (with the help of our government) has done this to protect its astronomical profits and many conservative organizations and individuals have gotten on-board because of long time alignments with big business. But today we must look beyond historic political alignments and find a solution for the planet. That is why many are coming around. The science is clear. The world will soon be divided into those who are willing to make personal sacrifices for the future of the planet and those who will continue to go for everything they can personally amass. A third group, which I am a member of, will be willing to fight to save what s left. And the fight starts with speaking out!

GeneHey, cowboy :)

I guess you missed my post above. I watched the movie, and I addressed that response in my first post above. As you may notice, I found his implication regarding the Third World somewhat less than compelling.

warming.

OK, back to now. We are releasing CO2 directly into the system. The planet is warming. Warming can lead to more greenhouse gases being released (melting tundra, for example) which leads to more warming.

This is risky behavior on our part. We can already see effects and the greenhouse gases we've released will be in the atmosphere for a very long time. And we continue to add an increasing amount even as we speak.

Alarms are going off in the scientific world. We can see what is happening. A consensus of experts in varied fields are making the connections. This is an immediate challenge. How do we respond?

As you imply, it would be difficult to stop our current behaviors instantly. That would cause some immediate new problems.

But we can look at the total sum of changes needed to mitigate the greenhouse gases we produce. Then, look at possible solutions and the amount of mitigation available from each solution. We can then choose the optimal combination of solutions to apply, together, that add up to the amount of mitigation needed.

Here's one article proposing possible solutions:

"Humanity already possesses the fundamental scientific, technical, and industrial know-how to solve the carbon and climate problem for the next half-century.

over the next 50 years and limit atmospheric CO₂ to a trajectory that avoids a doubling of the preindustrial concentration. Every element in this portfolio has passed beyond the laboratory bench and demonstration project; many are already implemented somewhere at full industrial scale.

Although no element is a credible candidate for doing the entire job (or even half the job) by itself, the portfolio as a whole is large enough that not every element has to be used."

Here's their list - choose 7 to expand into solution "wedges":

1. Efficient vehicles
2. Reduced use of vehicles
3. Efficient buildings
4. Efficient baseload coal plants
5. Gas baseload power for coal
6. Capture CO₂ at baseload power plant
7. Capture CO₂ at H₂ plant
8. Capture CO₂ at coal-to-synfuels plant
9. Nuclear power for coal power
10. Wind power for coal power
11. PV power for coal power
12. Wind H₂ in fuel-cell car for gasoline in hybrid car
13. Biomass fuel for fossil fuel
14. Reduced deforestation, plus reforestation
15. Conservation tillage

Much more info in the article:

<http://carbonsequestration.us/Papers-presentations/htm/Pacala-Socolow-ScienceMag-Aug2004.pdf>

A similar article is in the September 2006 issue of Scientific American which focuses on "how to power the economy and still fight global warming."

Look for the issue called "Energy's Future Beyond Carbon." They did a great job of covering major options. Worth a trip to the library or ordering from the web site.

(Volume 295, Number 3 - www.sciam.com - with some free overviews available here: <http://www.sciam.com/issue.cfm?issueDate=Sep-06>)

Bill I like your idea of positive actions, and the quickest first action is to do everything we can to encourage efficiency.

A simple example is using a compact fluorescent light bulb instead of a standard incandescent light bulb. Both create light and heat. The CF creates more light, less heat. The incandescent bulb creates mostly heat, relatively little light. It should be called a "heat" bulb not a "light" bulb. It is, in fact, the heating element for the easy bake oven.

If everyone switches to CF, we can build fewer power plants and save on greenhouse gas emissions. While still lighting our lives. New LED lighting technology is also worth looking at for efficiency.

We need more technologies like those. From appliances to transportation to manufacturing. Energy policy should be written to encourage efficiency. Do the same work with less wasteful approaches.

This will also save money and stimulate new markets. Let's have some fun, indeed!

Cheers,
-Jamie

>I should have the right to fight for it.

And some of the scientific community disagrees.
They should be heard, not silenced, nor smeared.

If climate change (which even developing an actual "global temperature" is quite in dispute about) really correlates closely to sun activity, and the basis for calling carbon the culprit is in dispute, then the brave and courageous ones are on the other side aren't they? Especially with the viciousness of the campaign against them, they look virtuous, rather than scummy.

You are sure of being right. I am unconvinced either you or "the naysayers" are right at this point.

There are agendas (other than "saving the planet") potentially corrupting both viewpoints.

One thing we know is that the scientists are not going to be shut up, even when smeared and threatened with death, as Ball has been.

But then, he is just an "industry spokesman", right?

There is no evidence of that. It looks like a smear campaign.

I am willing to be wrong. I am still very worried about all this, but millions of us are still looking, without our minds made up. Don't think we are stupid, nor being stupid, nor greedy, nor grabbing to amass everything we can.

DC "Sarah" <sarahjane@sarahtonin.com> wrote:

>As you may notice, I found his
>implication regarding the Third World somewhat less than compelling.

Hi Sarah!

Hey, I think the African was telling the truth, and really wants the basics of civilization, but here is what really worries me about "playing it safe"

We are not only likely to ruin our economies, but, because of

huge loopholes in things like Kyoto (exempting certain countries from the goals) we are likely to drastically increase pollution and greenhouse gases as all manufacturing moves to the exempted countries. I saw it happen in the furniture biz here in California. My brother's company closed and moved to Mexico because of their pollution exemptions! The furniture biz is almost dead in CA because of ill-considered environmental regs, but thrives in Mexico, where the (much higher) pollution wafts right back across the border...

WTF?

Politics and socialism infect and corrupt most environmental movements. It's like the stupidity of being dependant on the middle east (of all places) for energy. Every time someone brings up the strategic horrors of this situation, someone starts talking about "alternative energy". It's like our worldwide crisis, which could lead to a huge war, is their "big opportunity" to remind us of geothermal... ??

Oh, and our president gives his brother's buddies in FL, "no drilling" laws to protect their precious ocean views from the heartbreak of looking at drilling platforms... (hey wasn't he an oil-company shill?)

We have become so selfish...

My solution would be to slam the door on both the energy industry lobby, AND the environmental lobby, and first go on a crash diet to eliminate middle eastern oil in ten years.

First, we drill drill drill. Don't like oil platforms? Move to Antartica.

At the same time, we look at every viable alternative and take it as far as it can be taken.

Manhattan-project priority to both projects.

And NO scientist should be smeared nor threatened unless it is proven that they are corrupt. We MUST remove ideology from this process and get the truth.

We need the truth, not the "truth", meaning my truth or your truth, and the damn shouting loudmouths on both sides need to lose their place at the table.

That movie did not create the opposition to the global warming

consensus, it simply exposed it.

my .02

DCBTW, I think that if we had a president that was actually capable of doing the right thing, he/she would be assassinated asap.

The really fugged-up thing is you just don't know which side would do it first?

A middle eastern wacko?

An Oregon anarcho-enviro wacko?

(sorry, not you those guys down 5 a ways)

An energy industry hit man?

Tim McVeigh's cousin?

This is what is so bad about the times we live in. It is not that certain people want an apocolypse, it's that I am not sure anyone can stop it...

I would love to be wrong.

DCHey Jon! Glad to hear you finally got a DM-3200. We are going to need a full report when you get some time in on it:)

Can you tell us anymore about what you think of it so far? The big question is, how are the mic pres, and of course the overall sound??? I hear the pres are good, and the mixes sound good, but I'd like to hear from you on this. Down the road, it would be cool if you could post some audio.

There is a lot to learn with that one. You should go to the Tascam forums for help, I hear the manual is not so great.

I see some advertised for \$50 but don't know if they can do the high res.

Thanks for any tips.

JohnWhile the "right thing" is certain still under debate, I think the
reality is that if the President were to attempt a radical shift in
our energy policy, he would find his political (i.e. financial)
backers would desert him long before an assassin's bullets, bombs, or
infectious poodles would ever have a chance to work.

I am amused by all the debate on this subject in this newsgroup, but
until large sections of our economy no longer rely on petrodollars,
the changes people desire are not likely to come about by governmental
proclamation. Thousands (millions?) of jobs (= livelihoods = votes)
are at stake.

In an analogous, fashion, what if the President declared that ProTools
was now banned? How many studios would go out of business as a result
of that? Hmmm, come to think of it..

I once had a contact for the 80 pin flat ribbon cables. I cannot find it
now. The newer cables appear to be some kind of SCSI protocall.

Not without some major surgery to the back of the case. The 13 slots on the
backplane will take up the area where the I/O connectors are located on a
normal mobo and the spacing between the slots may not line up exactly with
the precut slots in case backplate.

What evidence is that?

Should we ignore all the major evidence that CO₂ was a contributor to previous warming events?

Should we ignore the compelling evidence that CO₂ is a primary cause of the current warming event?

From: <http://gristmill.grist.org/story/2006/12/26/224933/67>

"Objection: In the geological record, it is clear that CO₂ does not trigger climate changes. Why should it be any different now?

Answer: Given the fact that human industrialization is unique in the history of planet earth, do we really need historical precedent for CO₂-triggered climate change before we accept what we observe today? Surely it is not far-fetched that unprecedented consequences would follow from unprecedented events.

But putting this crucial point aside, history does indeed provide some relevant insights and dire warnings.

During the glacial/interglacial cycles, temperatures and CO₂ concentrations showed remarkable correlation. Closer examination reveals that CO₂ does not lead the temperature changes, but lags by many centuries. Even so, the full extent of the warming can not be explained without the effects of CO₂. Though these cycles do not demonstrate that greenhouse gas initiated warming, they do lend credence to the importance of CO₂ and CH₄ in setting the planetary thermostat.

There are also events in geological history when sharp rises in temperature were initiated and driven by large spikes in greenhouse gases -- not unlike the fossil-fuel-emissions spike today. The Paleocene Eocene Thermal Maximum is such a case. Roughly 55 million years ago, ocean pH levels dropped drastically and global temperatures rapidly rose over 5°C. The resolution of available proxy records indicates that this occurred in a period of time no longer than 5K years; it's not possible to know if it happened even faster. The likely cause was massive releases of methane from the ocean floors, perhaps due to some smaller warming or changes in sea level. It took over 100K years for the ocean, atmosphere, and temperatures to return to their previous state. The result was a mass extinction event that took millions of years to recover from.

We can also look at the formation of the Deccan Traps. In this case, a massive and sustained volcanic action altered atmospheric chemistry and caused a drastic climate change, one that led to the extinction of the dinosaurs. And Snowball Earth theories involve the build-up of greenhouse gases as the mechanism by which the earth eventually escaped

its frozen state.

In short, it is simply untrue that history lacks precedent for greenhouse-gas-driven warming. The precedents are there, as are the dire warnings."

>>

>

> Then can you explain

>

> a) why the earth didn't continue to heat itself into oblivion

What do you mean by oblivion? The earth has been very hot in the past. Luckily for us, the earth has lately come to a balance that currently favors our species.

Clearly the balance at various times in earth's history would not always have been so favorable.

The balance now is pretty good for humans, so let's not screw it up.

> b) what caused the eventual cooling periods

Which ones? There are many drivers of climate.

This is an interesting article about ice ages:
http://en.wikipedia.org/wiki/Ice_age

We don't want that, either.

The current problem we face is warming, and the data suggests human produced greenhouse gases are contributing to that problem.

Since we control what we produce, we have the opportunity and responsibility to do something about it, for the sake of future generations.

Cheers,

-Jamie

However, there is a strong case that there is money to be made in new energy development. And a lot of patriotic benefits in transitioning to more forward looking energy policies.

Plus, Don has been wrong in the past. So I'm optimistic. :^)

> www.JamieKrutz.com Did anyone take a listen to Dimitrios Call My Name MP3?

Great song with a wide dense mix. Really like the singer (I'd move her up a bit in the mix but that's just my opinion) - nice job Dimitrios!!!

Thanks for sending the signal paths etc. and a bit of the history also
- Dimitrios you should post the song and info if you do not mind...Don, science is full of disagreement and that's the way science works.
Theories are created and tested. Data accumulates and is evaluated. Many divergent voices are heard in the process and ideas are tested.
Conclusions are reached. Some theories are supported by the evidence, others are not.

Fossil fuels PR flacks have exploited this innate process of disagreement and testing to pretend there is reason to fail to act. Because creating the illusion that it's too soon to act achieves their client's aim of encouraging hesitation. Why? Probably because they perceive action on this issue as a threat to a business model that encourages greenhouse gas production. (Some of the biggest "smear campaigns" probably originated with those folks.)

And so we hear a lot of well financed misinformation and amplification of any shred of disagreement. And all of that gets repeated ad nauseam in an attempt to drown out the consensus of mainstream climate science.

There is room for disagreement in science. Peer-reviewed studies talk, BS walks. If someone has a good theory backed by strong data with repeatable experimental results, the scientific mainstream will come to them. If they don't, fuggedaboutit.

At this point, given the scientific consensus and the potential risks, global warming denial is foot dragging, foolish and yesterday's news.

The world is moving on to face the problem and deal with it.

Cheers,
-Jamie

evidence shows complex interactions and wide changes to climate.

As you can see from that link, scientists who now recognize human-caused
greenhouse gas production as a significant driver of the current warming
event, also fully recognize other climate drivers involved in this and
previous events.

For scientists conclusions are based on evidence, and the evidence
points to human causes for the current global warming event.

immediately call it a distortion.

Whether Kyoto chooses the optimal set of solutions or not is a different subject. I haven't been proclaiming for or against Kyoto.

The distortion I'm referring to here is the notion that "it's too late so why bother." Whether you hear it from a radio show or a shill web site set up by the fossil fuels industry.

Anyone who is seriously arguing that position will have to show me data to support it. I haven't seen any reason to accept that defeatist attitude, other than protecting the status quo for one industries current business model.

What I have seen is the well supported position that a combination of solutions, engaged in now, has a good chance of making a worthwhile

difference for future generations.

> And therein lies the dilemma I have...the teapot calling the kettle black
> syndrome

Hah! That's it in a nutshell. That is the crux of the PR campaign.

Misinformation and amplifying of pretty much any objection into "hold it" status is the goal. To portray the science as if there's a huge controversy. To imply that scientists don't know enough. That the majority of climate scientists are ignorant bullies and finks, and probably hate your momma, while the few scientists who don't agree with the consensus, along with all the lobbyist supported PR flacks and radio talk show hosts are surely gallant unsung heros, bravely fighting for YOU.

> (859) 635-5762 Friends of mine are setting up their production studio, and we just
installed a new pc for running Reason and stuff.

They're using an M-Audio usb keyboard controller.

Here's where the confusion comes in. If it's connected via USB, the pc sees it, Reason sees it. I can select it as a midi in source and assign it through one of the busses to an instrument. However, when I arm that instrument's track and hit "record", it doesn't record any midi notes. Keyboard is still playing the synth, but the sequencer isn't recording anything.

Now, if you use a straight midi cable through the Emu sound card instead of usb, it still is seen by Reason, still controls an instrument, but this time, when you arm the track, it sees midi data and records notes.

Any ideas? This is a stumper to me - I've had very little practical experience with midi.

Thanks.

http://www.apple.com/macpro/Or you can just use form SR, wait for somebody to steal one of your songs & make it a big hit, then copyright that song on form PA, and sue the person who stole your song, using your returned form SR date & a copy of the CD as evidence that the song is yours.

:D

>HI Gene,

Awesome!

Now we all get to wait for Intel to fix all the memory and buss bottlenecks in next years chip set version. They are doing a AMD type Hyper Transport buss/memory system. Then you should see the 8 core really shine. When the new chip set design comes out will just need to swap the motherboard and be good to go. Oh wait)

Of course maybe by that time all these tiny little audio and video software and hardware companies will have rewritten their applications to be fully 64 bit too.....not.

My first band went through an abbreviated version of that.....3 managers in 4 years followed by a split. Luckily for us, we were so friggin poor that no one figured they could get a penny so we walked away from it. Somewhere in the fray, my Super Reverb, Bassman, Gretsch Tennessean, and two old strats ended up going bye-bye.....but part of that was to pay the dealer (a singularly evil kinda' person.even during the *Summer Of Love*) so that he wouldn't kill the girlfriend of the roadie who used to score the little black biphphetamine 20 capsules and other stuff that she used to buy for manager #3 so he could turn around and give it to the band members so they could stay awake long enough to practice, gig and finish their high school homework in order to keep working so that they could pay said manager his cut.. The Turtles didn't mention the dealer and the roadie's girlfriend, but I'll bet they were both part of that gig.

Gotta' love those bands.

;o)We certainly have different perspectives. My Quad core MacPro has been problem free and lighting fast both in OSX and under Bootcamp. Last month when I was away, I got to play with a Pro that had the CPUs upgraded to the Quads

X 2 (essentially exactly the same machine as the new 8-Core) Digital Performer (my primary app) used all 8 cores and ran like a gazelle. When switched to Bootcamp, Nuendo (demo) also seemed to run exceptionally fast, although we did not check for processor leveling.

and reliable and hopefully capable of reducing the total number of computers I run when working on extremely large projects. My Quad Pro is fast, but when doing orchestral work, I still need at least one or two additional computers. The 8-core and Logic 8 may finally allow me to do very large track count projects and still have multi-instrument orchestral samples playing un-rendered in real time. That is a specific goal I have been trying to achieve for several years, as I typically like to add orchestral sweetening at the last stages of a production / arrangement.

See, you HAVE to do things that way, though - since musicians are always broke, the only way you can screw them out of money is to manufacture it in that manner & then never let 'em see any of it!

lolChris can correct me if I'm wrong, but most of the issues I've heard about with dual quads was with Nuendo not scaling to take full advantage of all cores - this was with some intense benchmark testing, not just normal use, and I haven't actually heard if there are any scaling issues with DP, Logic, etc.

That maybe somewhat architecture related (or so Chris seems to be implying). Quads are still fast, just perhaps not as fast as they could be.

Gene - when Logic 8 is out (any word?), and you get a chance to test with a dual quad, I would be interested in hearing the results with running orchestral libraries. I'm adding another PC at the moment for just that purpose, and while running it all on one system is somewhat appealing, I am guessing we may still have reason to keep an extra one or two systems around to share the load - the libraries aren't getting smaller. The ability to run everything at low latency for me surpasses any inconvenience of multiple systems (mainly the extra licenses), esp. since Nuendo can run them as external instruments with multiple live inputs.

Also, what is your opinion of DP vs. Nuendo and Logic? Just curious.

Regards,
Dedric

I'm running track counts well into the 30's & 40's (depending on the song) without having to freeze too many tracks... a half-dozen maybe, depending on the plugin's they're using, with an off-the-shelf Gateway Pentium Dually & 2 gigs of RAM. And this is at 88.2k/24-bit. Prior to the Gateway I was using another PC that I had built, but at 2.2Gigs of Athlon 64 single-core it really just wasn't cutting it after awhile (you know, it's the old: "the more it's capable of, the more I'm gonna push it" cycle).

So yeah, you can get some fairly big track counts if you configure your rig properly.

Neilprobably not till june when 10.5 is slated for release. they have also put the cross grades back up for sale, again due to the delayed 10.5 intro.

i'll defer to gene on the merits of your last question but logic does use less cpu recourses that dp in my experience.

acoustic drums, but also send triggered signals to a MIDI track
for layering of samples later.

Has anyone here compared the DDrum triggers to the Roland ones
in actual use? The Roland ones have an output control, which I
suppose could help to prevent double-triggering, but then, the
brain I'd be using for this project has a sensitivity control as
well, so I don't know the output controls on the actual triggers
would make much (if any) of a difference in that case.

NeilWhen I contacted Hart Dynamics re: this subject - Peter their rep said
either the DDrum or the new Roland trigger are excellent units so the choice
is yours.

Gene

Of course they found away to knock it. What would you expect?

Here is the performance info:
check out Music and Audio.
<http://www.apple.com/macpro/performance.html>
<http://www.apple.com/macpro/intel.html>

These test were done in july 2006.

I'm sure Adobe CS 3, Logic, FCP, and any software running on Mac OSX will be able to utilize the processors. I'm sure it's not going to be slow by today standards. However, if your going to compare it to future computers, well....When it can do commercial AV software, let me know.

I have never said ignore the evidence...but what I am concerned about is that you seem to feel that every piece of evidence that contradicts CO2 as the driving force behind Global Warming is nothing more than Oil Industry propaganda.

Even within the very paper you quote it states that CO2 does not cause Global Warming...it is a factor...but not the single driving force behind Global Warming.

On a different note I was listening to a local talk show and the host quoted some figures regarding CO2 reduction...one being that we could close down all the Oil refineries in Alberta and all the manufacturing in Ontario and we would only reduce our National CO2 output by less than 50% of the required reductions mandated by the Kyoto accord. As to how accurate he was, I can't say for sure but he is quoting from leading economists, scientists etc.

So in essence we shut down our country's economy and we're still not even 1/2 way to our 1990 CO2 levels...

Something is wrong with this picture

No PCIe here at all...
Just simple PCI like your "vintage" Paris-magma setups.
I once had this but could not make Paris cards sit inside Magma and have
an undistorted sound.
I now may guess that there could be a PIO/UDMA conflict that I discovered
recently !!
I was working with pio mode !
Sometimes pc sees the harddrives as pio so it have to be reconfigured...
So magma would be my next new try again...
I want to have at least 6 eds cards...

> propoganda.

Science is based on theories that are tested. Disagreements are common.
A consensus comes from what the data supports. Some theories are
supported others are not.

Anything else is probably distortion from special interests. The sheer
volume of distortion on this issue has been impressive.

From implications that climate scientists are so stupid they've
overlooked other climate drivers (they haven't), to claims that any
possible objection of the mainstream consensus is enough to cast into
complete doubt years of research and mountains of data (nope).

> Even within the very paper you quote it states that CO2 does not cause
> Global Warming...it is a factor...but not the single driving force behind
> Global Warming.

Don't confuse one event with another. In the past event discussed, the
driver was not initially CO2, but CO2 was released by the beginnings of
the event and it then contributed the major warming to that event.

In the current event, we are releasing CO2 (that was previously stored a
long time ago in the earth), and our action is contributing to the
current global warming event.

> On a differnet note I was listening to a local talk show and the host quoted

> I can't say for sure but he is quoting from leading economists, scientists
> etc.

Yet another distortion that is making the rounds. The "it's too late
anyway so why bother" distortion.

The truth is no single solution will solve the problem. It's going to take a combination of solutions. Any solution by itself will look like a disaster.

From: <http://gristmill.grist.org/story/2007/1/24/18548/9954>

"Objection: The kind of drastic actions required to mitigate global warming risk the destruction of the global economy and the deaths of potentially billions of people.

Answer: Is this supposed to mean the theory of anthropogenic global warming must be wrong? You can not come to a rational decision about the reality of a danger by considering how hard it might be to avoid. First things first: understand that the problem is real and present.

Once you acknowledge the necessity of addressing the problem, taking action suddenly become less daunting. There is no point in discussing the best solutions or the cost of those solutions with someone who does not yet acknowledge the problem.

But even if mitigating global warming would be harmful, given that famine, droughts, disease, loss of major coastal cities, and a tremendous mass extinction event are on the table as possible consequences of doing nothing, it may well be we are faced with a choice between the lesser of two evils. I challenge anyone to conclusively demonstrate that such catastrophes as listed above await us if we try to reduce fossil fuel use.

Now, in terms of conservation and a global switch over to alternative fuels, the people who oppose doing this for climate change mitigation are forgetting something rather important. Fossil fuels are a non-renewable resource, and as such we have to make this global economic transformation regardless, whether now or a bit later. Many bright minds inside the industry think we are already at peak oil. So even if it turned out that climate mitigation was unnecessary, we would still be in a better place as a global society by making the coming switch sooner rather than later.

Seems like a win-win situation to me."

OK, onto the multiple solution topic: I posted this list of possible solutions before. It's worth checking out just for the idea that we can evaluate and choose the optimal combination of solutions:

"Humanity already possesses the fundamental scientific, technical, and industrial know-how to solve the carbon and climate problem for the next

half-century.

over the next 50 years and limit atmospheric CO₂ to a trajectory that avoids a doubling of the preindustrial concentration. Every element in this portfolio has passed beyond the laboratory bench and demonstration project; many are already implemented somewhere at full industrial scale.

Although no element is a credible candidate for doing the entire job (or even half the job) by itself, the portfolio as a whole is large enough that not every element has to be used."

Here's their list - choose 7 to expand into solution "wedges":

1. Efficient vehicles
2. Reduced use of vehicles
3. Efficient buildings
4. Efficient baseload coal plants
5. Gas baseload power for coal
6. Capture CO₂ at baseload power plant
7. Capture CO₂ at H₂ plant
8. Capture CO₂ at coal-to-synfuels plant
9. Nuclear power for coal power
10. Wind power for coal power
11. PV power for coal power
12. Wind H₂ in fuel-cell car for gasoline in hybrid car
13. Biomass fuel for fossil fuel
14. Reduced deforestation, plus reforestation
15. Conservation tillage

Much more info in the article:

<http://carbonsequestration.us/Papers-presentations/htm/Pacala-Socolow-ScienceMag-Aug2004.pdf>

And who says that what I wrote above is a distortion?

On one hand you expect me to accept that your position is undeniable and overwhelmingly supported by the scientific evidence yet when I suggest that there is possibility that living up to Kyoto could bankrupt the economy you immediately call it a distortion.

And therein lies the dilemma I have...the teapot calling the kettle black syndrome

These are exaggerations meant to help us say, "hey wait, we can't just go rushing off to fix the problem. Let's wait."

Bingo. Waiting is the goal of the fossil fuels lobby. That's all they want. Put it off.

And if we wait until it really is too late, too bad.

Cheers,

-Jamie

www.JamieKrutz.comHAHAHA! I'm going to practice this today.

Paris has been an awesome system. I intend to continue working with it, but I'm considering an ITB solution to use in addition to Paris. I've got some jack to throw at a new computer, but not top dollar -I'm thinking maybe 800.00. I haven't checked out a barebones system or what it would cost to roll my own, but Dell is selling a system that includes an Athlon 64 X2 dual core 4400+. 1 gig of ram. 250gig sata drive. (I'd get a separate audio drive.) Anyhoo, I know there's lots of if ands and buts, but, any thoughts on what kind of real world track counts are possible? Or alternatively, I'm trying to run about five soft synths, ten tracks with loops (a la Acid) and 16 - 20 audio tracks --so probably at least 10 compressors, a couple of verbs of the auxs, and eq on all at least 24 tracks. I'd rather not have to "freeze" anything. Is this even approachable with a dual core athlon, or in this price range?

Thanks!

MR

>Hi Mike,
Track count would be fine but not sure on all the software synths and
effects. That will depend on what they are , how many voices, tec.

For raw audio track count with no effects probably around 60 to 70 @ 24

bit 44.1/48k. About half for 96k.

If the software synths you have are stream s samples from the drive then this will effects overall track count. If you put your sample libraries on a separate drive than the audio/project drive then this will help.

If you already have a custom built system then you should really look at going the Core2 Duo path. It would putting you in the 800 to 1000 price range and be allot faster.

You would probably be looking at 850 or so for a E6300, Intel brand 975 mobo, dual head video card and 2 gigs ram if you wanted to DYI it.

You will have to remember that with he X2 4400 based system there is little of no upgrade. It is already st the end of life for the chip and chip set. You will also have to check to see what chip set Dell is using on the AMD board. If it is an Nforce4 or Via then forget it.

You would need motherboard, ram , video card, cpu and maybe a new power supply. You can reuse your case and most all your drives.

There is a price drop happening I think in June for the current Intel Core2 Duos depending on when you are looking to do the change.

Chris

Here's to doing something! A lot of people are taking it seriously and working on solutions. Individuals, corporations, communities, states, and most countries.

The worldwide discussion is now about solutions. That's a very good thing.

I have to disagree with any inference that most climate scientists are ignorant finger-pointing pots or kettles with an ax to grind. They are, by and large, hard working, insightful, intelligent people following the data and testing rational theories, and making conclusions based on the evidence.

Conclusions based on scientific method and evidence are not mere "he said/she said" assertions. I think you'll find that most climate scientists are very careful to not overstate their conclusions. If someone makes a wild claim that the science is overstated, it's very likely they are misquoting or misunderstanding the conclusions - in some cases deliberately so in order to create a negative impression.

I do agree that well funded PR flacks starting with self-serving conclusions and working backwards to justify them in any way they can, even if it means distorting the science or exaggerating disagreements, are indeed pots and kettles both. Beware the FUD campaign, it is well funded and far reaching.

If you've ever sat in on a meeting with climate scientists (I have) you'll know that they will question each other intently on data, methodologies and conclusions. They will question each other and examine each other's work relentlessly. When conclusions make it through that sort of peer-reviewed gauntlet, we are wise to pay attention.

Thanks for the discussion, Don!

Cheers,
-Jamie

Here is a very compelling version of what several of you have been presenting here. Well written, well-reasoned.

Now, read the comments.

What is important to me is that real scientists are raising real issues about this, and the global warming folks are not answering the issues, but are claiming consensus...

In other words, shutup.

It all begs the question of who is right, as does the "play it safe" crowd.

Consensus is not always right. Look at some of the presidents we have elected.

Politics is not science. Smear campaigns are not argument, and claiming consensus is an inadequate response to actual scientific arguments.

DCNice article, Don.

Scientific discussions are great. Heck, science is all about identifying problems, coming up with rational theories and then testing those theories, multiple times, to see what is true.

The reason there is a consensus on global warming is that questions have been raised, discussions held, a lot of research done and conclusions reached.

I wouldn't expect 100% agreement but the amount of agreement is quite high.

Research is ongoing, so anyone with a theory to test had best get on it. Feeling like the mainstream is wrong? Bring out a new theory and test it. If data supports it, we have a new mainstream.

But after years of doing just that, the evidence is already strong enough to suggest three things. One, the planet is warming. Two, human causes explain it where other causes don't. Three, the risks to our species is high. And four, waiting for the last couple of scientists to be satisfied increases the risks far higher.

Since we know that most of the possible solutions have other benefits, it's no wonder that most governments have concluded we may as well get started.

Smear campaigns are not necessary between scientists because there is a better method. If a scientist has an alternate theory, it can be put to the test. It will succeed or fail.

Industry PR distortion campaigns are a huge distraction, but people can see through them eventually.

Cheers,
-Jamie

It seems to me like it has pretty much come to a stop with updates. They
still haven't even updated their installer package. It's was the only
software that I gave up trying to install on Ubuntu.

Everything else was based on the newer user friendly methods.

>(859) 635-5762HI Bill,

Power supply is under powered.
Only 1 PCI-e port so no expansion
no on board firewire
no quad core support
only 2 memory slots.

The configuration I'd recommend runs about 950.00 on Tiger direct.

Good Quality Mid Tower case
Intel E6600
Intel 975XBX2KR motherboard
2 x 1 gig DDR2 667mhz ram
XFX dual dvi fanless video card
Thermaltake 550w power supply

>Thanks James -

I haven't been able to do all that much on it yet other than noodle around with the Cubase 4 demo song (which is real annoying after 3 or 4 listens). Then I decided to to sell my RME HD9652 and buy the 2408 for the interim because 8 channels of ADAT wasn't going to cut it for learning anything (the DM3200 has 24 channels of TDIF and only 8 of ADAT without additional cards) and the firewire card was seriously backordered. Then my Cubase motherboard died and the board I bought to replace it refused to post consistently ...which ate up a week ... then I had to get another mobo... and now I'm trying to get 2408 and DM3200 to play nicely in their clocking sandbox and have discovered that everyone seems to be using an external clock to get good results with this set up. I don't want to spend any more money on an interim solution when I should be seeing shipment of the new Tascam firewire card within the next week or so. So for now I'm just sort of pissed and frustrated and wondering why I deserted my trusty old Paris rig. What's funny is that after I get this going I'm still probably going to use Paris as a stereo summing bus or something. (in fact I'd welcome more suggestions on that front).

The manual's not quite as hideous as advertised, but it's not that great either. Kind of cursory for a board so deep with features. One of the DM3200 usergroup guys made a pretty good tutorial, set-up DVD. Not as entertaining as Aaron and BT's Paris DVD, but quite useful. Geared more for a HD recorder rather than a DAW though, so I'm left to my own feeble devices and to whomever of you more experienced peeps will answer my questions when it comes to using it with Cubase 4.

I have to say though, that what I am seeing so far is that thing is going to be very flexible once I've gained some real facility with the interface.

I'll be sure to give an update as soon as I get out this "equipment needed to actually finish the new rig not here yet, equipment that is here not working or dying, why the f*ck did I think I needed to do this again" limbo land.

I can say that CD's sound great played through it though! :>)

Cheers,

Jon

(859) 635-5762 Hey all,

I'm thinking of doing something I never thought I would consider again. No, not the one involving a lemur, Crisco, and Meg Ryan. I'm thinking of buying another amp. A friend is selling a Savage Macht 6 that I played. I've been a Brit distortion guy for 15 years, playing an AC-15 inspired, point to point wired Top Hat, sometimes using a THD power soak. The Savage is a class A six watt 6V6 amp that is headed squarely into Deluxe territory. Having played it there are two things I like about it. First, at moderate breakup it sounds a lot like a tweed Deluxe. Second, when pushed a bit beyond that it sounds more like one of those lovely 18 watt Marshalls than pretty much anything I've ever heard. So to me I'd be getting two pretty sweet sounds (plus a nice clean sound I won't use much) in one club volume friendly package, used but in pristine condition for under \$1k.

Any strong opinions out there for or against Savage amps?

If it weren't for the Audacity guys, I don't think Ardour would have VST support. I especially like how the Ardour guys are complaining about buggy VST plugins crashing Ardour and claiming it isn't Ardour's fault that it crashes... (Exception handling anyone?)

> With companies like SSL behind them, I think they will give the commercial

> software guys a run for the money. What do you think?

SSL isn't actually supporting him any more...

While there is indeed a beta version of 2.0 out, it seems to me that Paul is spending more time looking for funding and trying to get people to help him for free (Google Summer of Code for example) than he is spending on actual

coding.

BTW, if you're really into the free stuff, have you checked out Rosegarden?
Less hype, but more capabilities...

Doug

<http://www.parisfaqs.com>Haven't heard one, but a lot of people like 'em. Price seems reasonable.

I see less and less of this. Scientists, like everyone else, need a means to support themselves. they have to constantly churn out *something* in order to get paid by *somebody*.

I know some enviro activists around here who would starve to death if everything they lobbied for suddenly came true. They suddenly wouldn't have a pot to piss in and would have to actually get a job (gasp!!!) or would have to find something else wrong with something in order to justify their existence. Since getting a job would entail working for some evil *capitalist* or becoming one themselves, they aren't likely to do this. These types, IMHO, are easliy as culpable in our failure to address the energy catastrophe that is approaching as are those in the energy sector.

DeejMy friends son got the LE version of Cubase bundled with a Yamaha keyboard he bought. He says it only deals with midi. I have zero knowledge of Cubase, but told him I am sure if he got the full version, he would be able to record audio tracks with it. Was I right? What can you guys tell me? Can he do lite pipe or digi I/O to record in Cubase? Costs?

What do you mean you see less and less of this? Are you talking about climate scientists? Where and whom?

What is it about making a living that automatically implies selling out?

I'm not following you on that one but I'd like to.

However, I think the blanket demonizing of scientists has got to stop. It's unfair, inaccurate and obviously a projective, diversionary tactic by special interests in this case. Better to recognize the problem, the risks and get to work on solutions.

BTW, I have a lot of respect for people in the long chain polymer

economy. We just have to realize what our true costs are, recognize the resource limitations of non-renewable economies, and be realistic about the cost/benefit analysis going forward.

So now who are you talking about? What organizations are actively standing in the way of their own success on their core issues?

I wouldn't expect this to be a defining problem. If a problem gets solved, then great! Move on to the next one. There is no shortage of problems that need attention.

I have met great people who strive to live up to laudable ideals in both corporations and non-profits.

Cheers,
-Jamie

The biker pulled over and said, "Build a bridge to Hawaii so I can ride over anytime I want."
The Lord said, "Your request is materialistic, think of the enormous challenges for that kind of undertaking; the supports required to reach the bottom of the Pacific and the concrete and steel it would take! It will nearly exhaust several natural resources. I can do it, but it is hard for me to justify your desire for worldly things. Take a little more time and think of something that could possibly help mankind."
The biker thought about it for a long time.

Finally, he said, "Lord, I wish that I and all men could understand our wives; I want to know how she feels inside, what she's thinking when she gives me the silent treatment, why she cries, what she means when she says nothing's wrong, and how I can make a woman truly happy."

The Lord replied, "You want two lanes or four on that bridge?"

>Hi Steve,
No demo version. Yes stupid but true.
If they go to the Help and about window in Cubase LE and it is version 1.02 or higher then it will definitely do audio. It will depend on them at that point to get a sound card with a ASIO driver so they have proper audio support.

At least Apple doesn't steal from others, and then turn around and sue when somebody copies their products. You don't see Apple suing their resellers, or under privileged kids and their single parent mothers.

This is just more typical Microsoft greed! Boo hoo hoo, MS didn't get as much per copy, boo hoo hoo!

Next you'll hear how Gates, the wonderful philanthropist, gave money (bribed) a south american country to make sure MS products and thinking are taught in their schools, and used by their government and people.

Let me know when Debian is ready for prime time. That means, easy to install, easy to maintain, and runs all the major commercial softwares. . . Oh.

Mac OSX it is, then!

The problems have nothing directly to do with Apple or Microsoft. It's Intel's shortcut for the architecture used with the 5000x chip sets. Although not a show stopper by any means it is not letting the CPU reach their full potential in speed especially when a system is fully loaded with hardware. The big issues on the PC OS side is that XP was never coded to take good advantage of 8 cores whether it be 64bit versions or not. Vista works better with the 8 cores but comes with its own set of issues that I'm sure we are both aware of. :)

The CPUs themselves are fast as hell the bottleneck is happening with the north bridge/south bridge controller parts. OSX is handling it better for sure.

With Nuendo on the PC most people don't notice the performance loss unless they are running very low latencies i.e. 256 or less. Nuendo is much faster on the 8 cores of course but it should be considerably faster. It seems to be a very Cubase/Nuendo based. No other applications I've have tested acted this way. I got better low latency and cpu load performance out of Samplitude, Sonar and Reaper with similar sized projects.

I hear that. I've been happy since using XP64 and being able to use more ram. Of course still not more than 4 gigs because of lazy software coders but I've got no control of that. Being able to address more ram has always been a big factor for Apple with the big boost in speed from the Intel hardware and the amount of ram that be used on that hardware is awesome. I've always hated the ram limitations in windows since I started dealing with soft samplers. Gigastudio was always a lame program to have to deal with. It's even worse since Ascam took it over. With the new faster hardware using a MAC for large Orchestral stuff will be

the best way to go for sure.

That would be, shut up Mr. McCloskey, to you."Gene Lennon" <glennon@NOSPmyrealbox.com> wrote:

>

><http://www.apple.com/macpro/>

Wow Gene, this is totally cool! With 8 cores it should be able to run a few plugins. I wonder what else is up Apple's sleeve. I wonder if they will have the rumored new smaller tower any time soon. Then there's Logic, FCP, iLife 07", and the rumored touch screen thing. It's going to be an interesting year. Hey James

It was originally 800mhz. The guy I bought the system from had put in a new processor. I believe its rated at 1.7 mhz.

> In Scandinavia, electrical products must have 2 years warranties to get sold but Apple wouldn't follow these rules at all, as far as I read in Norwegian newspapers a few months ago. Understandable, the Apple way, when plenty of Ipod's began to get problems after a year, but great problems for Norwegian resellers that couldn't get paid for these reparations at all from Apple. So what Apple is saying about warranties and what they're doing around the world are just two different thing, as far as I can see.

....for me, it says much about Apple and their quality, when reading these kind of things;-)...

NAB is in 10 days. Look for FCP. FCP should run nice on the OCHO. I cant

talk about Logic....shhhh!

GeneApple has a standard warranty which is about the same as other manufactures.

Apple also has a 3 year extended warranty that can be purchased at the time of sale, and up to 12 months after the sale on the product. The buyer should know this, and every Apple dealer knows this in advance of any sale, so I don't see how they can complain.

So let see some news articles on this subject. I think I can smell some bullshit on this one.

By the way the post was about MS!

Kim.You don't like Apple. So now your true colors are shining through, and I can clearly see the ax you have to grind.

This post was about MS. So show me where Apple was suing Norwegian dealers!

:)

On a PC, it's under a drop-down menu on the top - does the Mac version have that?

Yes, that is kinda nifty...

For some reason (ha! I crack me up sometimes!!!) it just started
working with the usb connection this afternoon.

Go figure.

pabAudio. We just need to find out how to hook-up the keyboard to it.For instance....

In several of my other programs I'll go to "Preferences" and it will show me the input selections of my audio card and motherboard to select from either Built in or from my card: Revolution digital in or analog in. For now he will have to use built in, because he doesn't have any light pipe or digi out on his Yamaha S-90 ES. But we are looking to get a special lan card for his keyboard and a digital card for his G4. I entered a post earlier mentioning that I am helping out my friends son here with all this.....

><http://im.live.com/Messenger/IM/Causes/As> far as I can see, Apple will only give a year guarantee on their Ipods in

Norway, when the law says two. There have been plenty of reparation on the product in these two years periode, well documented here in Norway, as far as I can read and understand Norwegian newspapers;-) When resellers can't get paid for the last years reparations by Apple, I can't find another word that they're suing the dealers here. Can't you see that a product that's so expensive should be free for problems the first 2 years, or is it too holy for you to talk about when the name Apple is being involved in shit like these;-)?

I like Apple computers very well but not well enough to buy something that's so overprized without taking care of resellers and customers in a good way, if it must be repaired.

So I don't think your feelings about Apple should run away as often as they're doing here with you, when someone are talking about well documented problems they have;-) When the name "Apple" is making a form for religious feelings like these, I must say they have done and is doing reall good marketing "jobs" in selling well overpriced products from "Jobs" around the whole world;-)

Maybe therefor, I'm very comfortable with most of my Behringer gear, that's doing the "jobs" well, without going up in fire at all.(As DeeJ can tell much about;-)) I must say, I haven't had a single reparation yet on any of my Behringer gear. (Maybe I have been more lucky than DeeJ with the damn cheap shit;-))

Heh!!!.....I'll say this for Behringer.....their tech support people are friendly and not arrogant at all and they don't give you any shit if there is *any* doubt about the product being broken. You send it in and they immediately ship another unit, or give you a refund.
>o)His lyrics have actually improved... ;-)

lol

>Hi Steve,

How to record audio in Cubase LE is pretty well explained in both "f1" html help file and in the Adobe PDF getting started and operations manuals. If your Cubase does not have these already installed then they might be in a folder in the Cubase LE CD.
If not I can email them or post them here for you. I have the PC version but they operate pretty much the same way.

As long as the s-90's analog out is plugged into the sound card's analog channels 1/2 inputs then you should be able to record them. Cubase by default will only create a stereo input and output based on the first I/O on your sound card. If the sound card is only stereo then you're good to go. Just create the audio track and set it to stereo. Record arm the track and hit record on the transport bar.

You will probably have to check carefully on OS9 support for currently produced sound cards. Some of the new ones don't have OS9 support.

Chris Ludwig

ADK Pro Audio

(859) 635-5762

www.adkproaudio.com

chrisl@adkproaudio.com
Top of the main page "Devices" - dropdown contains all the routing sections - input - output - vst instruments etc.

As for the actual channel...should be showing a small graphic on the extreme left side of your main window...that contains inserts, eq, sends etc and there should be an input and output section and your options for each i.e. midi routing, audio input audio output etc

Hope that helped but in truth your're probably totally confused

>Over priced is a matter of opinion. Apple offers a 3 year warranty. It's a choice to buy the warranty or not. The dealers know this, so they don't have much room to cry about this. Apple sets the terms of sale and the terms of their warranty, if you don't like it you don't have to buy their products!

Apple is having the iPod manufactured in the same foxcon plant everybody else is, so the quality should be about the same.

So if it so documented, post a link!

all of us here understand that, other than you apparently.

Why do you have such an all-consuming chip on your shoulder against MS? I don't have a problem with Macs or PCs, MS or Apple, but I'm also not in love with either one - neither is perfect. Are you a Mac reseller by chance?

Start looking at the world around you without the Apple-colored glasses on. There's more to life, and computer technology than evangelizing the Apple mantra. We aren't buying it and you are only hurting your argument, not that it should be an argument to begin with. Buy and use what you like, and post all you want about Apple products, but leave the crusade offline, please.

Thanks,
Dedric

>
>James,the new 8 cores have arrived..When can we expect to a new version of
>logic..??I do know about these companies. You should read up on the real history of
the two companies and the CEOs. I have a family member that was an executive
at a software company that MS decided to destroy. MS hired away their top
software engineers by bribing them with 1.5 to 3 million dollar starting
bonuses. Then MS gave away their competing product. The other software
had no real chance of surviving. MS now dominates that market segment.
The unethical, monopolistic business practices of MS are vary clear. It's
not Opinion. Go read the findings and know the truth!

MS has been able to lobby, bribe and by off politicians. That is how they
got out of all the anti trust judgments. The law were set up, but they don't
apply to companies like MS. We have the best government money can BUY!

When I see gates run down to some countries to bribe there officials, then
pat him self on the back because he gave a million dollars to a library,
I know what's up. Only stupid people, can't see through this. The guy has
no integrity. He is a crook and a thief. Just look at Vista, it's a blatant
rip off of Mac OSX.

When I hear ignorant bullshit about Apple or Jobs, I step up to the plate.
There are so many untruths that keep getting repeated about Apple. People
need to get educated about the issue. If any thing is mentioned about Apple
here on the NG the bashing starts. That's getting old.

If you don't like me posting, then quite the Mac bashing!!!!!!!!!!

So does the incessant and useless MS/Gates bashing, and that's all it is,
yet you still don't see it or get it.

Just calling a spade a spade James. This isn't about MS or Apple, it's about
your posts, yet you still don't seem to get that, so I give up. There are
other forums

that aren't hijacked daily by Mac zealots (or any zealot for that matter).

This used to be a great forum....

>Steve,

The differences between LE, SE, SL, SX, and the "4" versions are huge... the answers you got were valid for the versions the respondents are used to... but the settings and menus are completely different for each version. I sincerely doubt anyone here has actually opened up LE. I pointed you to the manuals because that is the easiest and fastest way to get the correct answer for your version... I could have read page 65 of the Getting Started manual and replied to you with the solution, but I thought I would point you to the documentation so you could find the answers to other questions you may have. My search for the LE documents took < 2 Minutes.

David.

called "VST Connections"? (This is what I was trying to ask you
before, when you chose not to help yourself by answering - I
don't have a Mac, nor Cubase for Mac, so I don't know if the
menus are identical!) If you DO see "VST connections", then THAT
is where you can choose which inputs on the card you can select
for each input buss in Cubase.
(but again, I don't have "LE", so I don't know if you have more
than one input buss as a choice in that version, either)

Nonetheless, what you're looking for should definitely be under
a submenu item called "VST connections" if it's the same as on
SX.

First, you have to select which audio device (under Devices - Device Setup - VST Audio System - ASIO driver).

Then, under VST Connections, Inputs and Outputs, add busses and assign them to whatever I/O is

available for that card. You can assign as many busses as your card has I/O.

You may or may not see drivers for onboard audio in the Device setup. The Revolution will probably show up as MME, but it may have ASIO or WDM drivers. You'll be best with ASIO. MME is way too slow to be useful for more than light playback usually.

Hope that helps.
Dedric

>>Umm... where did I "bash" Macs? That article was about the differences in charity giving between two CEOs. You are the one that posted the subject "Microsoft Sues software sellers", and many other antagonistic anti-MS/PC posts, and insertions into other threads to derail them into a Mac vs. PC debate.

We normally discuss technical issues, pros and cons here and don't seem to have a problem coming to agreement on what is fact and what is opinion, and agreeing to disagree... at least until now.

If you see that as bashing, then perhaps it's your defensiveness that needs addressing.
It isn't your job to tell the rest of us what to say or think. This is your move to make now James, not ours.

(Not that I can speak for the rest of the forum, but judging by some responses you've gotten, I think it's safe to say I'm not alone in my view on this).

>While it's rare to see me on the same side as James on something like this, the Gates Foundation makes me a little queasy. Keep in mind I work for what is in essence a foundation--we manage a big pile of money for a non-profit organization. It's just that we only give money to one 'charity' which happens to be Yale University. Investing that much money is not an easy task, and in many cases can do all sorts of odd things.

<http://www.alternet.org/story/47713/>

Second, the Gates Foundation has gone out of its way to defend intellectual property rights, including generic drugs. Having just had some direct experience with the effect that has on Thailand that issue is sort of close to me.

http://www.salon.com/tech/htww/2006/06/27/gates_buffett/index.html

It's a little hard for me to believe that an organization funded by two billionaires and being run almost exclusively by Gates family members could really claim not to have some conflicts of interest when it came to an issue like generic drug manufacture to enhance public health in the developing world. A group like mine is lucky because we make money so that Yale can spend it and the money we manage was donated to Yale so that Yale could spend it. No real conflict there. But I think the Gates Foundation swims in much murkier waters, even if I don't have James' 'Bill Gates banged my girlfriend in high school' hatred of the fellow.

James - you are constantly pushing your opinion (and that's all it is) based on what you *think* you know about these companies and frankly, most of here just don't care, other than the fact that it seems to be taking up a significant part of this forum now.

There is enough fact in the article for you to have seen that Steve Jobs isn't a charitable saint (didn't make the \$1M donation list from two independant charity/giving studies) - he's just a business man.

Please, please, please, if you can't discuss your opinion with a balanced attitude, give it a rest.

Time to climb down off the Apple high horse and realize that Bill Gates isn't Satan, and Steve Jobs isn't Mother Theresa.

These are companies making products to make a profit and I believe most if not

Shhhh... that was SSC in glasses... Made him look just like Gates...

There is no reason to get defensive about gear, folks...

I sit here every day and watch OSX scramble the desktop around a bit different every time I open it. Some folders don't open and populate on the first try! Oh, and the laptop is still referencing to the wrong time... All I have to do is buy the new OS to get the RIGHT BLEEDING TIME on my computer....

Rubbish...

And don't even start me on the damn Dell out in my wife's office... Did you ever think that Norton Antivirus is itself a VIRUS?? It imposes a huge tax on performance at all times, takes too damn long to load at bootup, regularly downloads stupid parental-control lists before I can get to work, and must be constantly updated to keep the box from turning into an advert-zombie, not to mention the constant vigilance of keeping up the anti-spyware app and running it because Gates lets any dildo who feels like it jam stuff into your registry...

Oh, and have you done a system scan with Norton recently?

Do you have the time?

As you all know, there's lots more...

Folks getting into a fight over computers is as stupid as the yahoos out here with the little piss-boy on the back of their trucks... The guys with the Ford trucks have the boy pissing

on Chevy or Dodge, and of course, the others guys have
piss boy peeing on the other brands...

It's flippin' retarded.

I am thinking of writing a tune called

"Everyone's Peeing on Someone"
(subtitled "Welcome to California")

Think Ramones...

Don't fight about computers....
It ain't worth it. No one cares.

DCNot a chance Larry. Dedric has stated here that he is intentionally going
out of his way to screw with me. He has made this personal. He doesn't
need to jump on my threads and start shit with me. Everybody else say what
ever they want, when they want and it's Ok. I'll cool it on any PC gates
Bashing, if that's what you guys want to call it.

James
