>

>TCBWhere's the fuel? You mean you finally noticed that Apple has gone to Intel for hardware designs, and onboard graphics on the low end models?

This is pretty old news. When Apple announced the Intel switch more than a year ago, this was one of the reasons given. The Macbook is their low end laptop, and probably the biggest cost reduction was using the

onboard graphics instead of something snazzier. The Macbook Pro has the snazzier stuff, but it's still off the shelf with OSX drivers. Apple doesn't and hasn't ever AFAIK developed their own graphics chipsets.

Well heck, they don't develop their own CPUs either, although I imagine they give input to those companies. Up until last year Apple chose different CPU models than were blessed by Microsoft, and tried to gain an advantage from the differences. Now they are using the same CPUs that Microsoft likes, so any advantage is going to be from design and software.

I like Apple's desktop case design. Really easy to get into and change memory, drives, etc.; quiet and cool running airflow. The laptop designs have varied at accessibility, sometimes compromising for thinness. For example my PowerBook is easy to access for memory upgrades but not for HD upgrades. That may have changed in the new ones.

Mac laptop sales are rising, other manufacturers are copying their form factor, but if you ever buy one (other than overpaying for a Macbook for someone else, and then complaining about it) I'll be amazed. Sorry you had to subject yourself to working on a Mac today, but even sorrier you had to infect it with XP. ;^)

Cheers,

-Jamie
