And not in Classic Mode, either. It needs to boot natively into 9.2.2. I believe the last Paris-friendly Mac was one of the Mirrored Drive Door (MDD) models.

Not only that, but the PCI slots in a G5 are a different standard and a different voltage, and would fry the EDS card.

pabl'd heard they are keyed such that you can't even plug an EDS into them.. can anyone verify, I don' t have a Mac at home....
