er and the UAD-1's.

Anyway, this is a fast rig.....real fast. All essential services are turned off and the registry has been pretty heavily hacked as well (after backing it up of course ;o)

Guess I could have just bought a Mac and plugged in a couple of cables though....huh?

der function. Is there any way to get EQs
also? I would really like a way to render all three.

Thanks

Here's the trick I do with SPDIF:

SPDIF Rendering

Patchbay workaround for bouncing tracks and rendering plugins

Tired of zeroing/clearing a mix to bounce a track or tracks to a new
file? Or wish you could render native plugins while listening and
adjusting in context. No problem.

Open the Patch Bay. Clear all your SPDIF I/O connections. Physically (as
in, on the back of your Paris 442 or MEC) loop your Paris SPDIF in to
your Paris SPDIF out with a short cable. Go back to the Patch Bay.

In the Patch Bay, connect the "Mixer Insert" SEND of the source channel
for the bounce to the left SPDIF output (dL) on your 442 or MEC. Connect
the SPDIF left input (dL) back to the same channel's "Mixer Insert"

Return to complete the loop. Now connect the same left SPDIF output to the "Submixer Input" of the Destination channel you want to bounce/record to. Select "External" on the EDS insert on the source channel.

Enable Record on the Destination channel. That's it. Record away. You can use your mixer normally while you bounce with no ill effect. And in a case of good fortune, since the EDS inserts are after the native inserts, any active plugins will be printed while bouncing. Great for rendering AutoTune or various other plugin settings for different song sections. For the price

ketchy pinning down which one, but on my system I =
have to=20

use card A and C and skip putting a MEC on card B or wierd stuff like =
this=20

happens (another hidden Paris 'feature'). The other thing to check is =
that=20

you have a good wordclock BNC cable running from MEC #1 to MEC #2.
