Here we go again! Apple has desk top models under 2K. Apple's market share probably has more to do with ignorant people spewing ignorant things about Apple.

Apple desk top models that start under 2K:

\$599.00
or as low as \$15 a month

Don't audio unit plugins get their own address space (I don't know, just wondering)? But anyway since OSX has 64 bit memory addressing, you're probably right that over time more apps will take advantage of it.

> There may be a few other limitations to running a full blown orchestral

No, not cheap, but it's probably more flexible use of the RAM than spreading it out over multiple boxes. If it's in one box you can use it for other apps more easily.

Yep, that is lame. Luckily the Mac can run MSWindows in another, uh, window, via Parallels or that other VM.

With the single quad, you could presumably add the other quad later to almost double the speed. Nice expandability for anyone who's \$500 short of affording the dual quad. But yeah, I'd buy the dual quad from the getgo if I were buying right now.

Interesting, I wonder if the optimizations are needed on the OSX side, if it's a Nuendo porting problem, or both.

Glad to hear you made up with your errant Touch! I hope it learned a valuable lesson by being left at home for a while. :^)

Don't show it to me when I come over or I might be tempted to get the next rev. :^)

Cheers,
