>But you can't _record_ that. Put another way, if Dimitrios fed the SPDIF of an RME Mutliface (BTW - running down RME gear on sonics is pretty ballsy in my opinion. Maybe not the best in the world, but certainly not the worst) and ran it through DeeJ's Benchmark it would sound like the Benchmark. So what Dimitrios is hearing is the converter. A perfect DA -> AD loop, with infinite sample rate and word length, would create exactly the exact same file as the original. So why do it? Clock jitter? You said yourself jitter is a record/playback issue. The file doesn't have any jitter, it can't any more than tape can have a head misaligned.

Even if the Mytek is used as an effect, if the RME converter is so awful, will the Mytek'd file played through it sound better? And how much better will the final playback devices be sonically than the RME?

I'm saying this is a bad idea

>I'm find that it can get a bit more colored than I'm used to but yeah, I'm
using in on all 18 tracks of an 18 channel mix right now. With the channel
set to default it uses very little in the way of resources but add some nice
mojo. It's possible to then just enable the different modules as needed
instead of all of them. On a 44.1 project, you can get a lot of these going
on a 4 card system and still have room left over to drop in the *vintage*
processors to taste.

You should give them a listen as see for yourself if they will work.

I like the new 805S a lot.
