>any good mobo like an asus or gigabyte (see dj's thread) or such will do.

i've tried to stay away from the ones with the onboard stuff built-in, although I had good times with the supermicro with the onboard adaptec scsi.now there's one you don't see alot...Supermicro..(or scsi....lol) but there damn fine mobos...they sometimes need a massage from the swedish prime-minister in terms of the bios ala dj's recent offerings....

I recently aquired 3 of their quad xeon super-servers via ebay and we're gonna put one of them in service in the audio dept...uh, this weekend I think...hmmm..my guru has the Big C and we're moving rather slowly for a while around here (and the swedish fella's been a bit of a pill about the ol' bios retrograde...lol) ...but hopefully we'll get'm up this weekend....

unfortunatly paris isn't getting one....what with the multi-proc issues....dag nabit....can you imagine paris on an 8g/ram 64bit/quad xeon?..holly heck!.....but nuendo's gettin' one so I'll finally be able to run everything I need outa that box....but I digress.....

>>There are 5 ways that I know of to do this.

1. Just send all of your tracks to a big analogue console and squash and mix them there just like you would with a tape recorder.
2. Send the tracks out the Paris inserts to an analog mixer, compress them there, then return the two track to a pair of Paris inputs.
3. Build a second single card Paris system and network the two systems. Install a Steinberg Midex on the system that you want to be a slave. Set the slave system with the Midex to slave to smpte and send a smpte audio track from the master system to the Midex on the slave system. Either send the drum tracks to the slave system or all of the other tracks to the slave system and keep the drum tracks on the master system, then use NoLimit or another stereo comp across the Global bus of whichever system (master or slave) has the drum tracks and route the outputs of the system run

acks through a digital matrix, looping it through busses on a separate DAW to a 2 bus comp, then returning the 2 bus to Paris and it is so much digital insanity and \$\$\$ that you may not want to go there, but it is very flexible and really works well if you've got a very powerful native system.

5. The last one is to strap an analog comp across one of the paris aux busses and crank the aux send to taste, blending the compressed signal in with the uncompressed tracks.....there's a 1.5ms latency doing this with an analog comp, only 2 samples or so doing it digitally. I do this a lot and it works very well.

I think our resident guru Dimitrios probably has other esoteric options for this using a palette of chainers, FX and wrappers, but I'm not sure.

;o)

THANKS for taking time typing all that!!

I'll most likely find the solution in Your little novel ;)

Sending the tracks out to a separate console seems to be a pretty smooth
way to me.

Thanks

Crescent wrenches are for PC's. Macs use a vise-grip and
J-B Weld...

DCGod Bless SSC and his Family.

Lo siento mucho...

El Miguel
